Introduction

1 Introduction

1.1 Kentico CMS Overview

Kentico CMS for ASP.NET helps you create powerful dynamic web sites with minimum effort. This document will guide you through the most important features of the system step-by-step, so that you can start creating your own web sites.

This document was written for evaluators and new users. It's intended for developers who create the web sites. It's not intended for end-users without programming knowledge.

If you need a more detailed documentation of some features, please see one of the following documents:

- Developer's Guide
- Web parts and Controls Reference
- API Reference
- Database Reference

Kentico CMS Support

You get free technical support during your evaluation period. If you need any help, please visit <http://www.kentico.com/Support.aspx>.

Part

Installation

2 Installation

2.1 Prerequisites

Before you start the installation, please make sure you have the following software installed. Other configurations may work too, but the system was not tested on them.

Server-side Requirements

- Windows XP, 2003, 2008, 2008 R2, Windows Vista Home Premium/Business/Enterprise/Ultimate or Windows 7 (both 32bit and 64bit)
- Microsoft .NET Framework 2.0 or higher
- Microsoft Internet Information Services (IIS) or Visual Studio/Visual Web Developer 2005/2008 built-in web server
- Microsoft SQL Server 2005, 2008 (including free SQL Server Express Edition)

Hosting Requirements

- ASP.NET 2.0 (or higher) and Microsoft SQL Server 2005/2008 support
- Medium-trust or full-trust permissions for the ASP.NET application
- If the server uses medium trust, ASP.NET AJAX 1.0 must be installed on the server.
- It's recommended that your hosting plan comes with 125 MB or more memory and 100+ MB database.

You can use your favorite hosting provider or choose from our [hosting partners](#).

Development Tools

If you want to create custom web parts or integrate custom code, you need **Visual Studio 2005/2008** or **Visual Web Developer 2005/2008 Express Edition**.

Supported Client Browsers for Content Editors

- IE 7.0, IE 8.0 (compatibility mode)
- Firefox 3.5
- Safari 4.0 or Firefox 3.5 on Mac OS

Supported Client Browsers for Site Visitors

- IE 6.0, IE 7.0, IE 8.0 (compatibility mode)
- Firefox 1.0.5+
- Mozilla 1.7.1+
- Netscape 7.1+
- Opera 7.52+
- Safari or Firefox on Mac OS

(the visitor browser requirements depend on functionality used on the web site)

Required experience

Although Kentico CMS allows you to create dynamic web sites without programming, you may need to

create custom web parts or to add custom code when developing a more complex web site. You should be able to create a simple application in ASP.NET 2.0 using Visual Studio 2005 and have some experience with relational databases and SQL, so that you can leverage the flexibility of Kentico CMS.

2.2 Setup installation

Troubleshooting installation issues

If you encounter any problems during the installation, please see **Kentico CMS Developer's Guide -> Installation and deployment -> Troubleshooting installation issues** or contact our support at <http://www.kentico.com/Support.aspx>

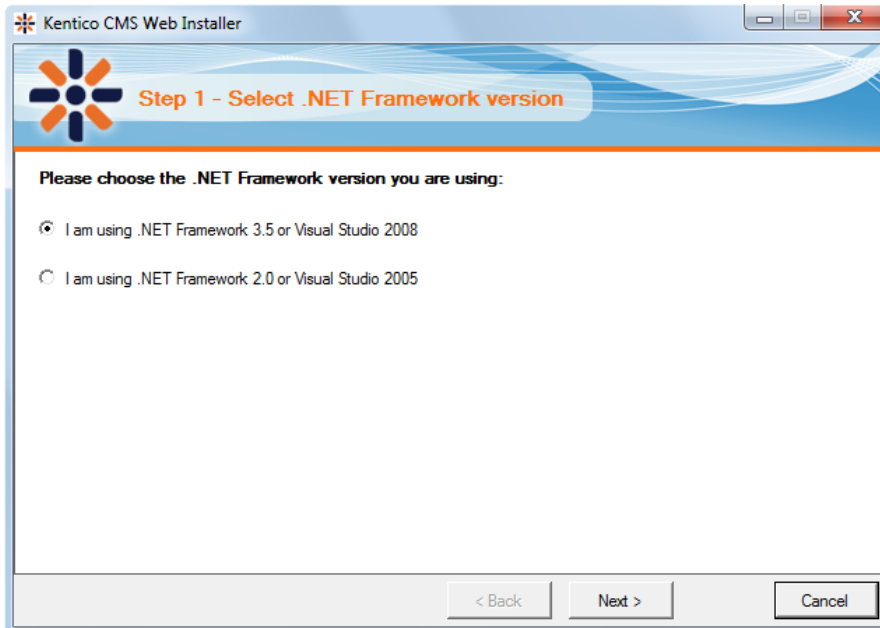

Run KenticoCMS.exe and follow the installation wizard:

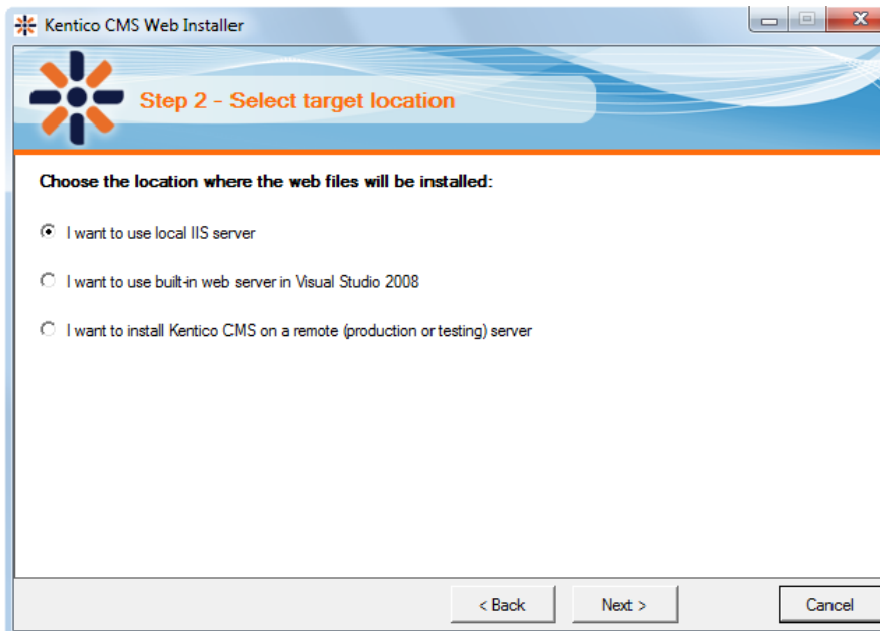

Read and accept the license agreement and click **Next**. Choose the installation location of the binary files and documentation on your disk. After the setup completes the installation, choose to **Launch Kentico CMS Web Installer** and click **Finish**.

2.3 Web application installation

Now you should see the Kentico CMS Web Installer. If you cannot see it, you can always run it from Start menu -> All Programs -> Kentico CMS 3.x -> Kentico CMS Web Installer.

First, you need to choose the version of .NET Framework and Visual Studio that you wish to use. Click **Next**.

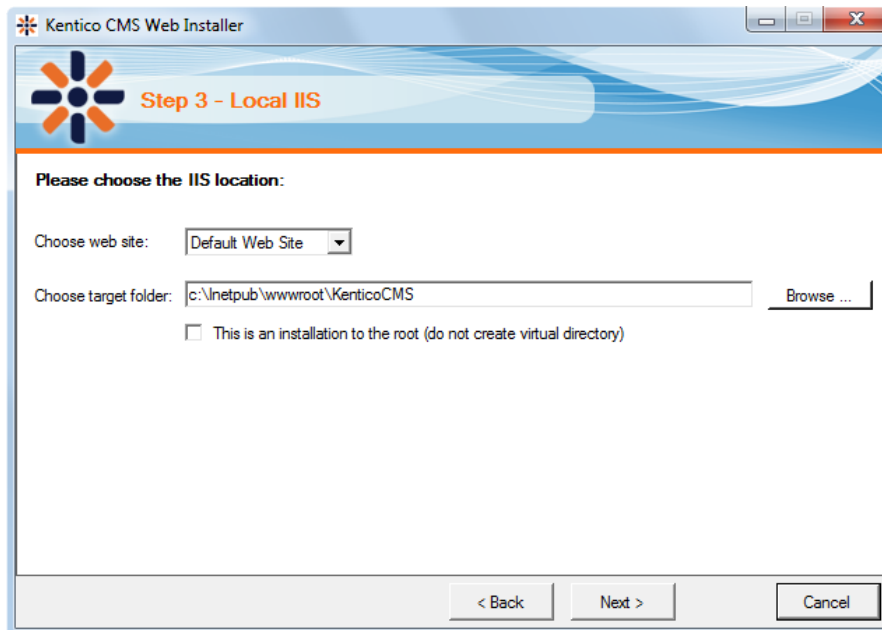

Choose to use either IIS server or Visual Studio built-in web server (if you do not have IIS installed). Click **Next**.

IIS installation

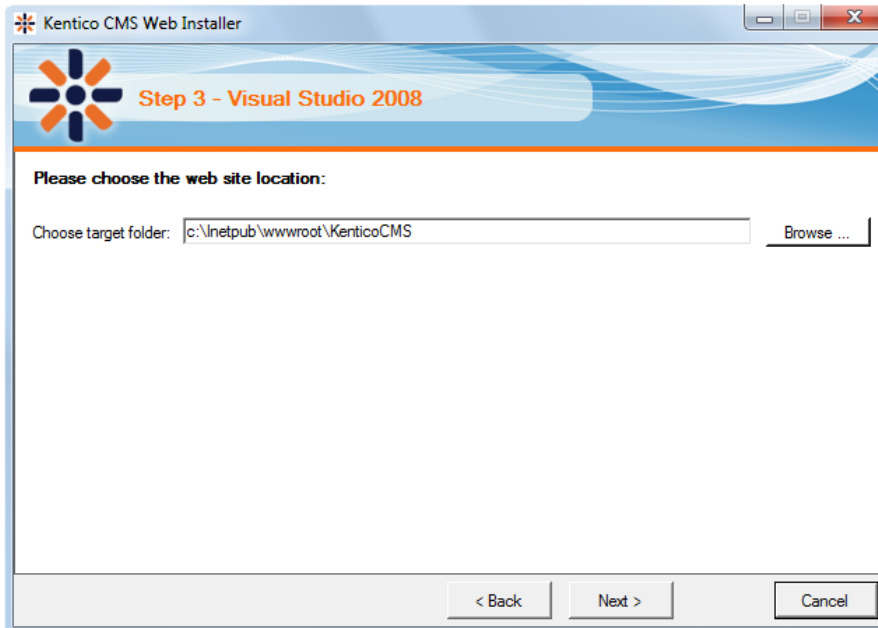

If you choose the IIS server, you can choose the web site where the virtual directory will be created and the folder on your local disk where project files will be deployed. The installer will create a new virtual directory on your server and configure it for ASP.NET. Click **Next**.

Please note: if you're installing Kentico CMS into the root of your web site (such as <http://www.domain.com>) and do not wish to create a virtual directory (such as <http://www.domain.com/cms>), please check the **This is an installation to the root (do not create virtual directory)** check-box.

Visual Studio installation

If you chose to use the built-in server in Visual Studio, you only need to specify the local disk where the project files will be deployed. Click **Finish**.

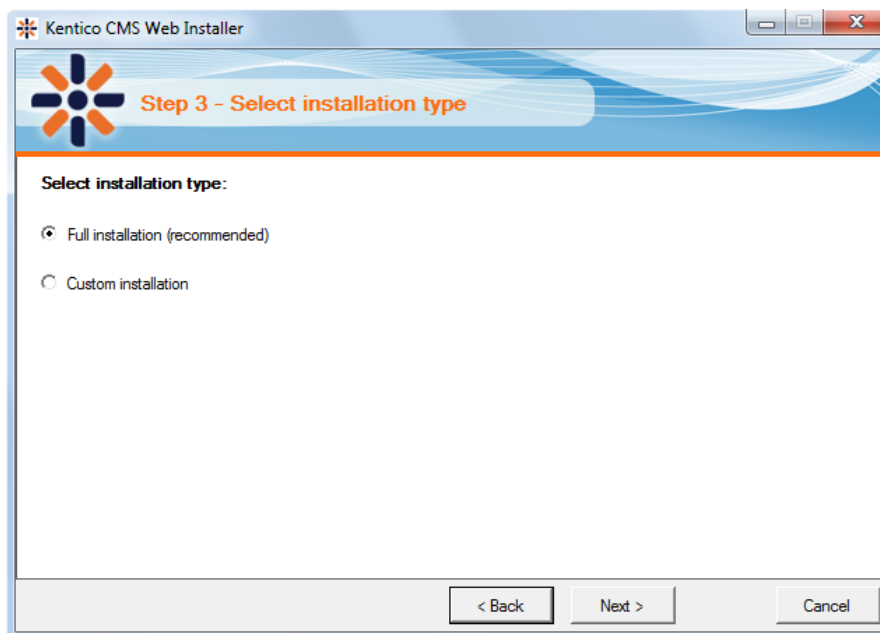

Type of installation

No matter if you chose the IIS or VS installation, the next step after specifying the target folder is the selection of installation type. The following two types of installation are available:

- **Full installation** - this is the recommended option for the purposes of this tutorial; in this type of installation, all components of the CMS will be installed
- **Custom installation** - in this type of installation, one extra step will be displayed, letting you choose which components you want to include in the installation

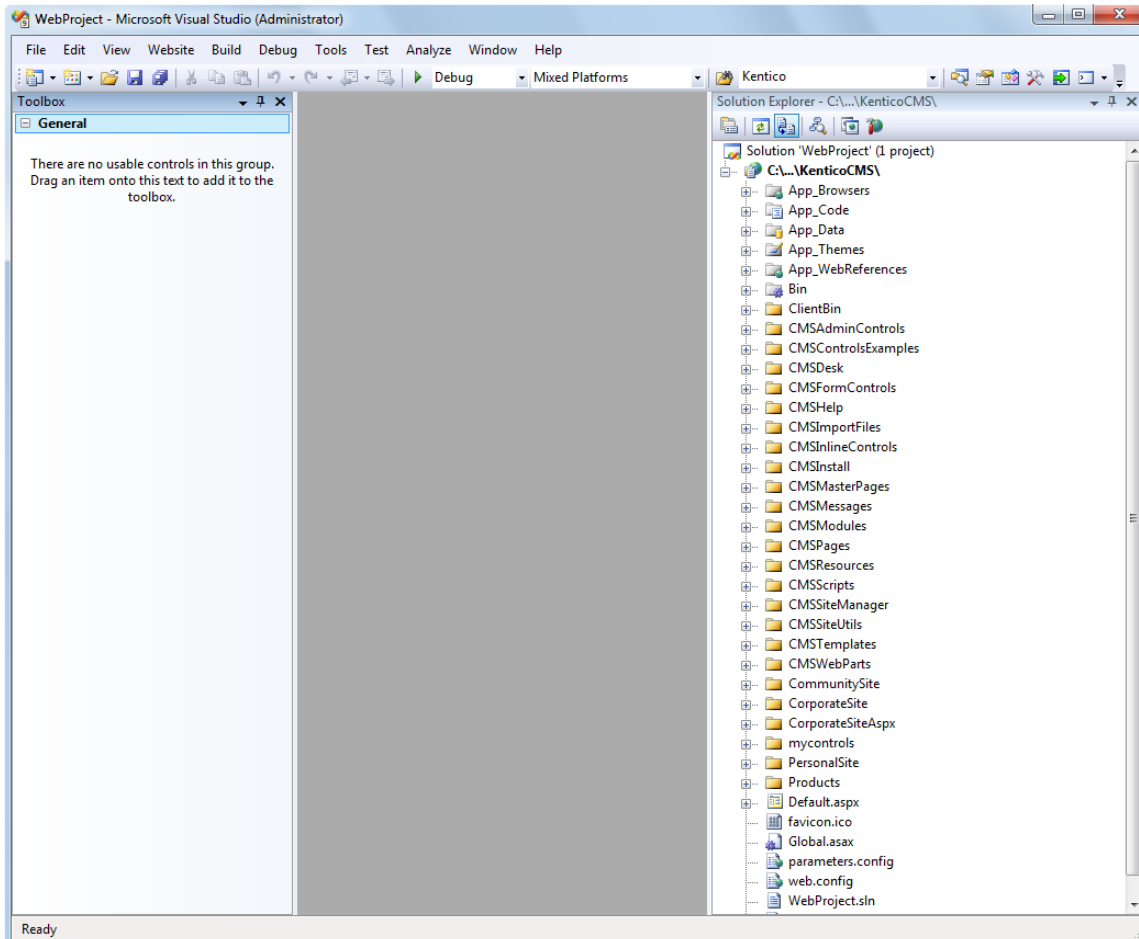

Click **Next** to start the installation process.

After the setup copies all files, you will see the link for opening the web application in browser or the web project in Visual Studio. **Click the link.**

Opening the web site in Visual Studio

If you chose Visual Studio installation, the project is opened in Visual Studio:

Choose **Debug -> Start without debugging** from the main menu. The site will be displayed in new browser window using the built-in web server.

When you cannot open the web site in Visual Studio

If the link for opening the project in Visual Studio doesn't work, you may need to start Visual Studio manually and choose **File -> Open -> Web Site...** and locate the project folder on your disk manually.

2.4 Database setup and Corporate Site

Now you should see the **Database setup** in your web browser.

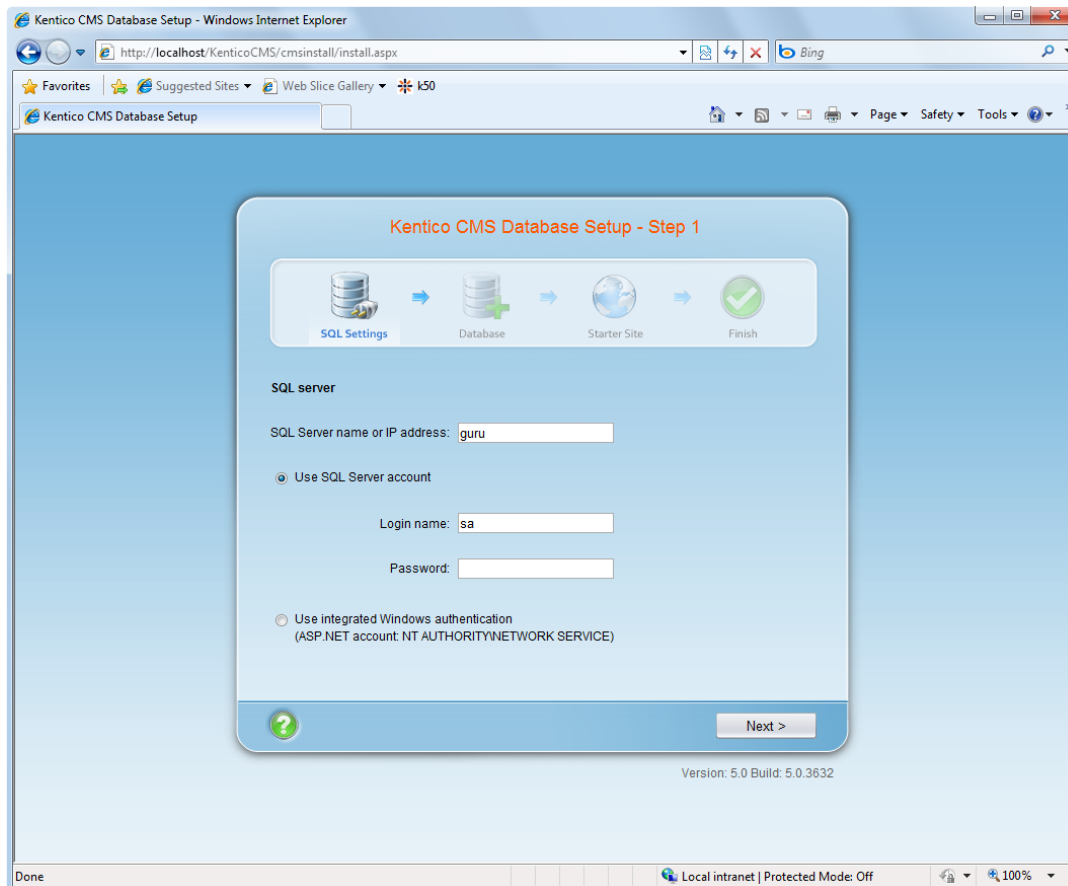

In the first step, choose the SQL Server name or IP address. If you're using SQL Server 2005 Express Edition, the default server name is `.\SQLExpress` or `(local)\SQLExpress`.

You can use either SQL Server authentication (recommended) or integrated Windows authentication.

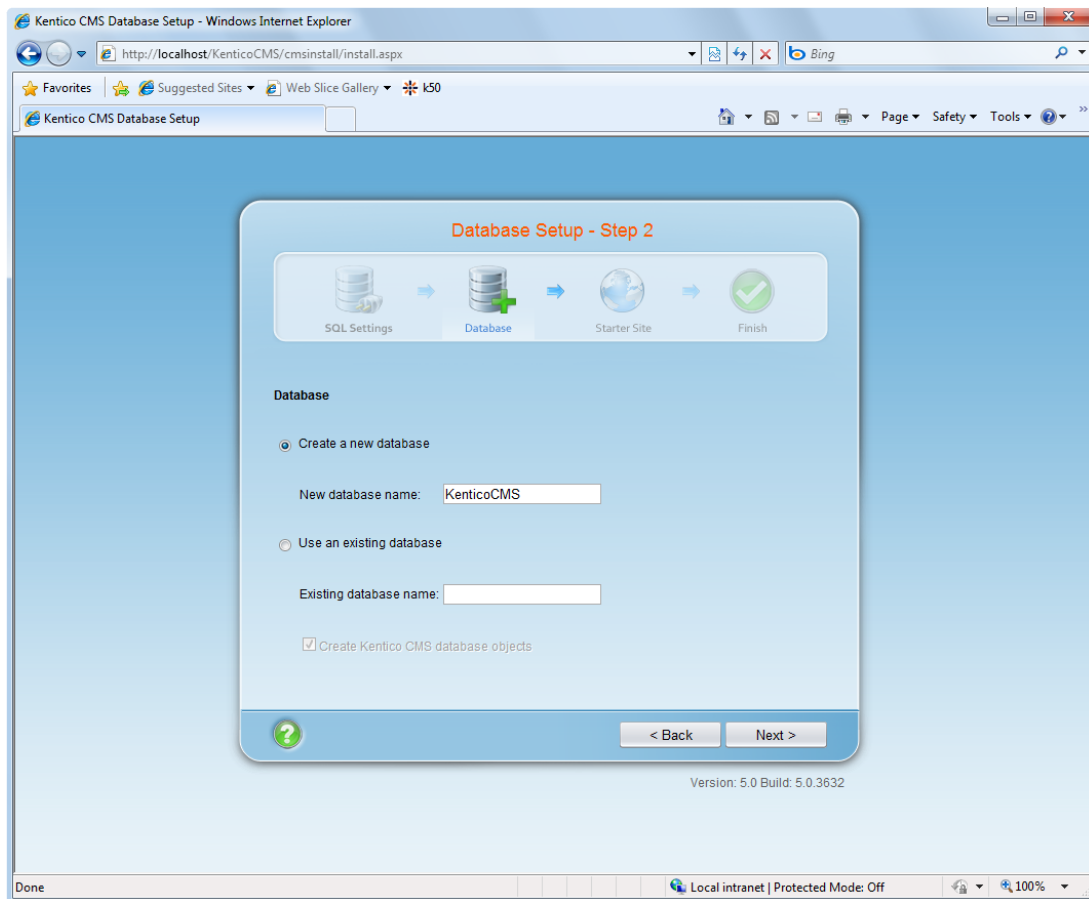

- In case you use **SQL Server account**, you need to enter the user name (such as **sa**) and password.
- In case you use **Windows authentication**, you need to ensure that the ASP.NET account of the name displayed in the brackets has an appropriate login name in your SQL Server.

The account must be granted with permissions for creating new databases or for creating database objects in an existing database.

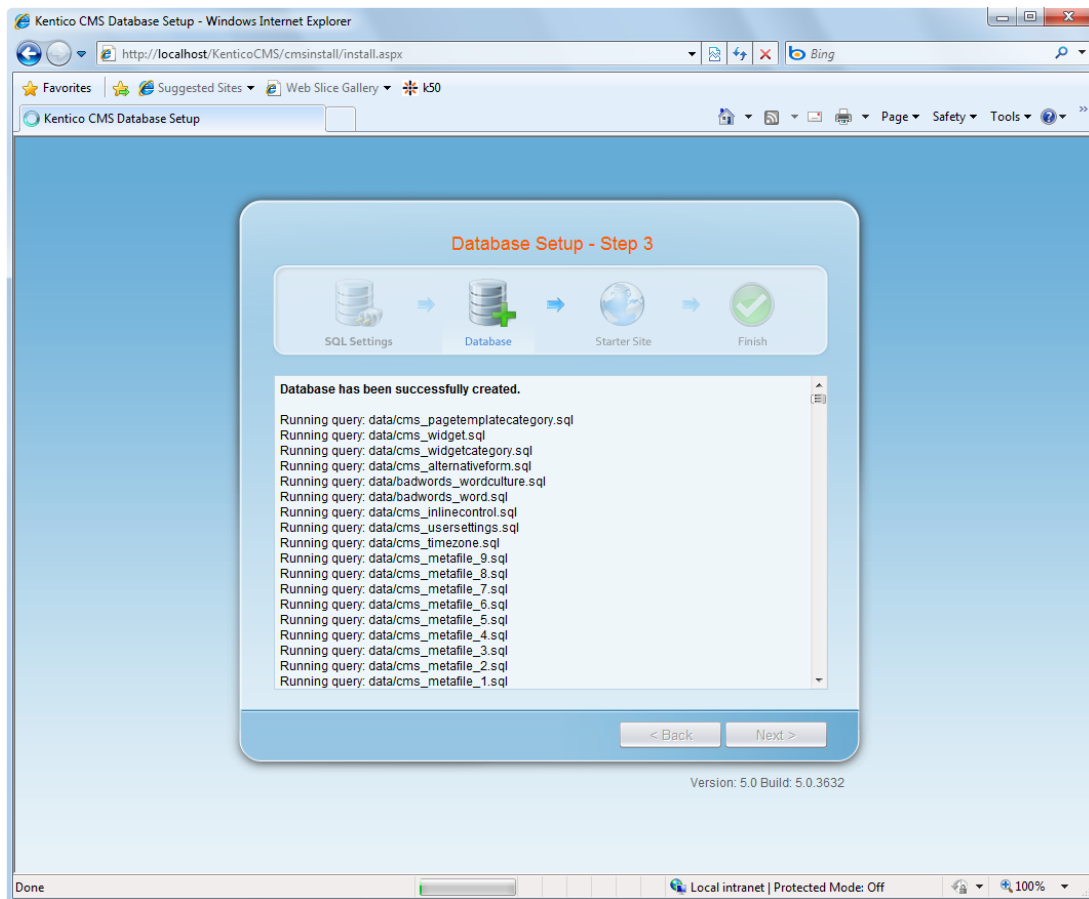

Click **Next**.

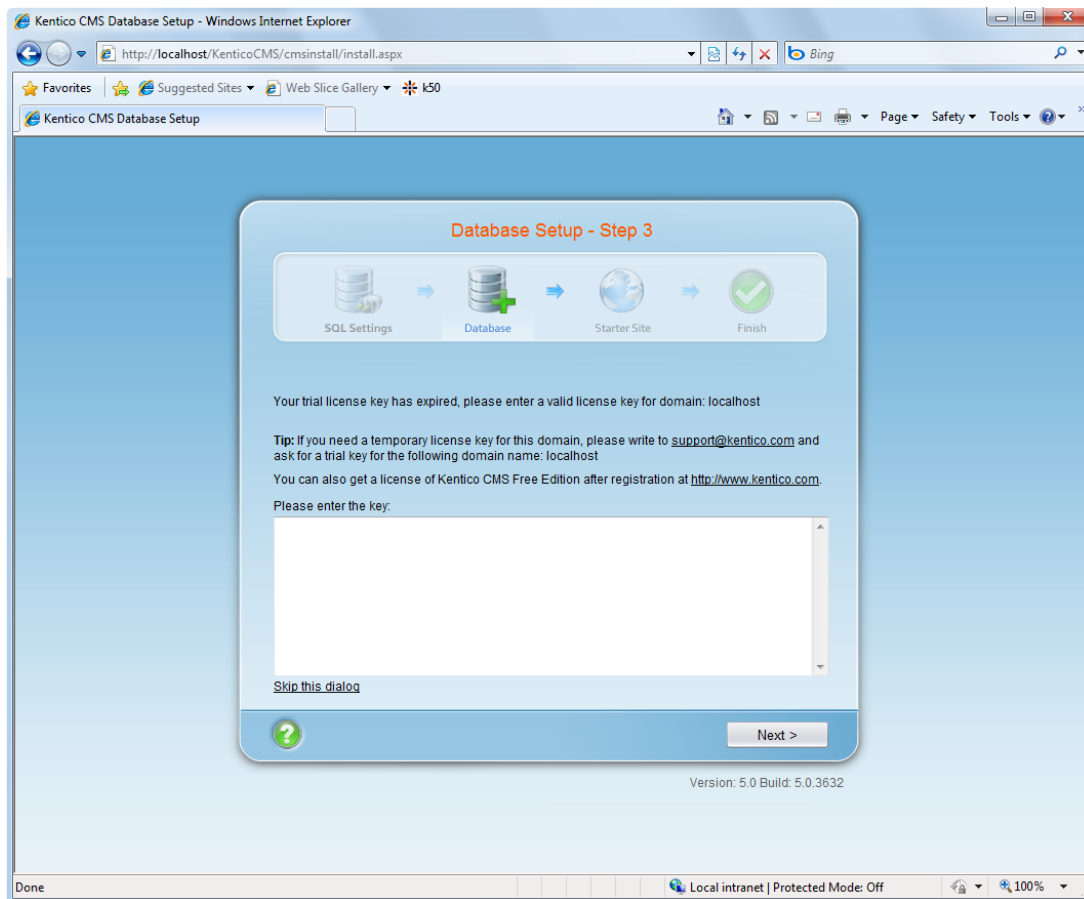

In Step 2, choose **Create a new database**, enter the name of the new database into the **New database name** field and click **Next**.

The database creation log will be displayed.

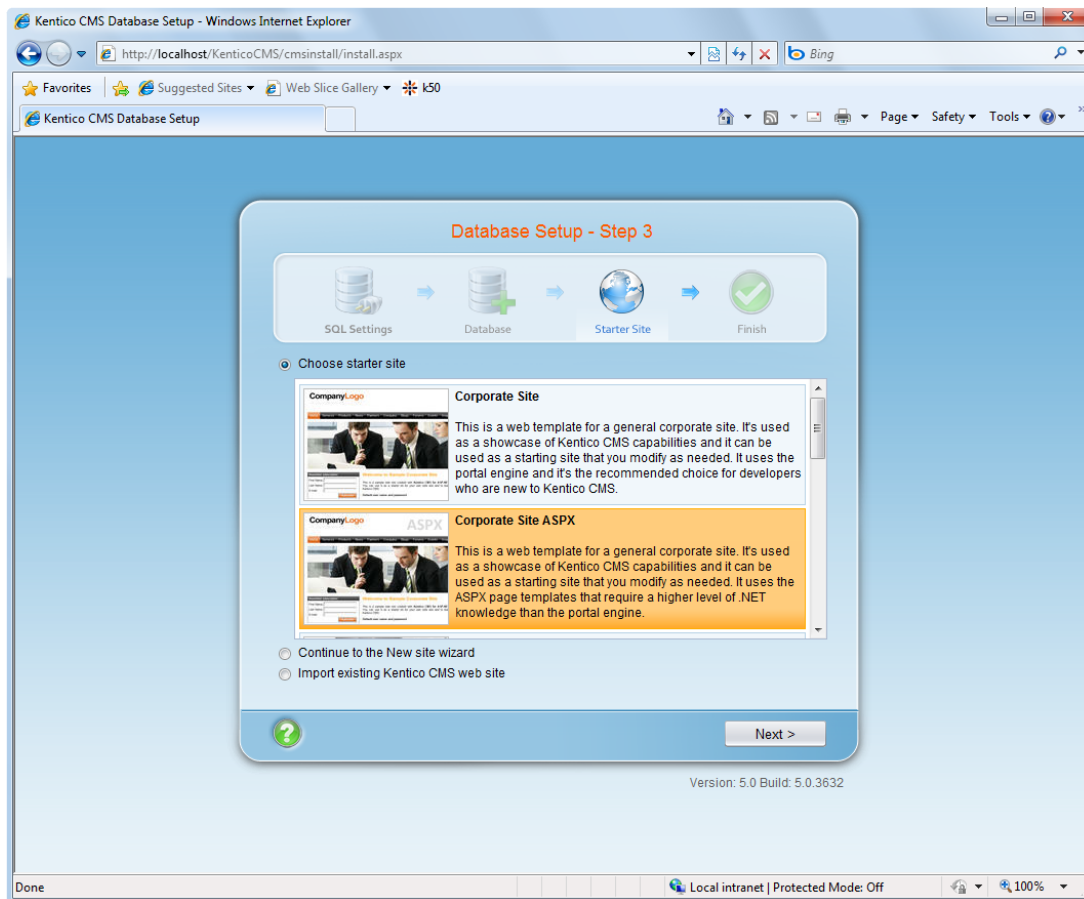

When the database is created, you will be asked to enter your license key. If you do not have a license key yet, click Next to continue in the trial mode. The functionality of the trial mode is the same as the full version.

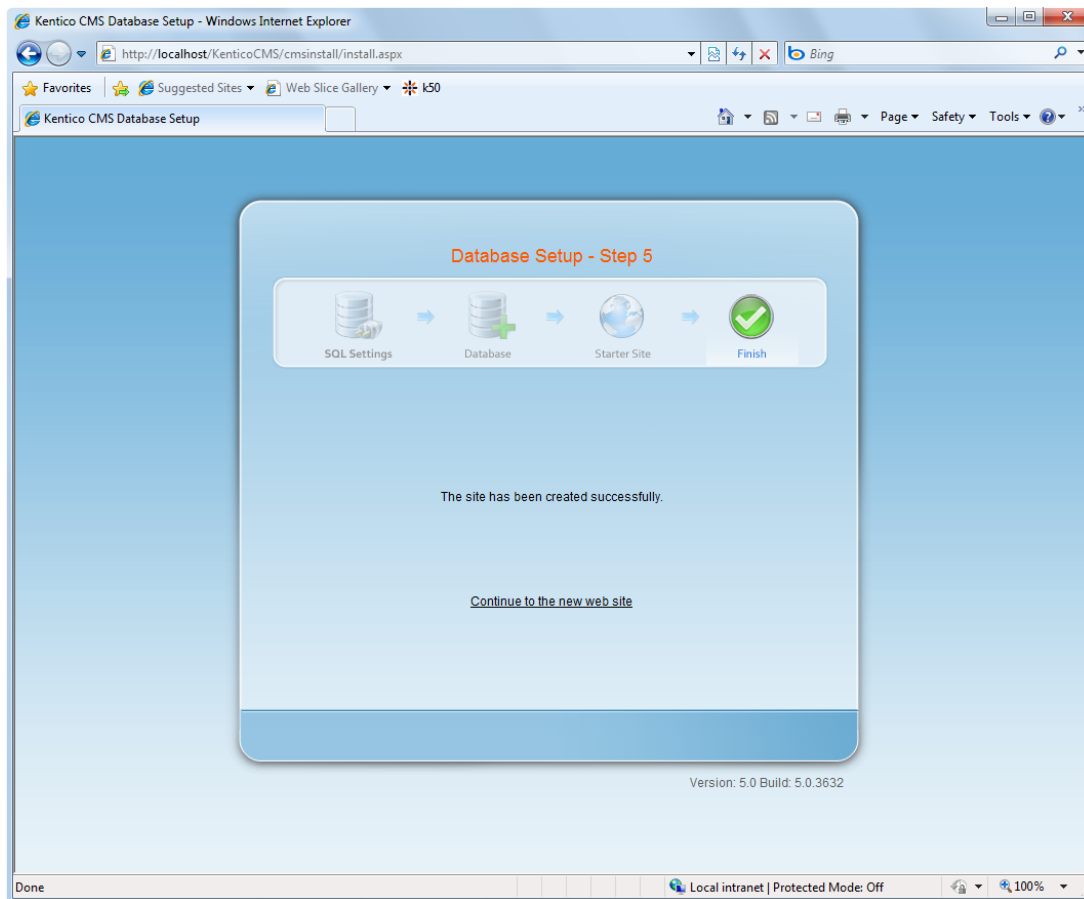

You can choose from the following options:

- **Choose a starter site:**
 - **Corporate Site (portal engine)** - this option installs the sample corporate site - it is **recommended** for most users, especially for **evaluators**.
 - **Corporate Site (ASPX templates)** - this option is recommended only for experienced ASP.NET developers who want to use ASPX page templates instead of portal templates.
 - **E-commerce site** - this sample site can be used as a starting point for creating your own e-shop and shows the possibilities of Kentico CMS's E-commerce module.
 - **Personal site** - this is a web template suitable for a simple personal site.
 - **Community site** - complex web template suitable for community webs, showing Kentico CMS's social networking features in practice.
 - **Blank site** - this is a blank site without any content; you will use it to create a new site from scratch.
 - **Blank site ASPX** - the same as above, but for ASPX poage templates.
- **Continue to the New site wizard** - this option is recommended if you're starting a new site from scratch.
- **Import an existing Kentico CMS web site** - use this option is you already created a web site with Kentico CMS and need to import it into the new installation (e.g. on the production server).

For the purpose of this guide, please choose to **create sample Corporate Site (ASPX templates)** and click **Next**. You will see the confirmation and a link to your new web site:

A log displaying creating of the site will be displayed. Click the link:

You will be redirected to the title page of the sample Corporate Site:

Corporate Site - Home - Windows Internet Explorer

http://localhost/KenticoCMS_2212/default.aspx

Corporate Site - Home

Welcome to the Sample Corporate Site

This is a sample web site created with **Kentico CMS for ASP.NET**. You can use it as a starter kit for your own web site and to learn Kentico CMS.

Default user name and password

You can sign in to CMS Desk (the administration interface) using the link at the top of the page or by going to the following address <http://localhost/KenticoCMS/CMSSDesk> (if you're using the default installation path). Use the following credentials:

User name: administrator
Password: Leave the password blank.

Getting Started

[Kentico CMS Tutorial](#) will guide you through Kentico CMS. You can also get help at <http://www.kentico.com/Support.aspx>.

Sample web site

The Corporate Site web site is only an example of a web site you can create with Kentico CMS. You have full control over the site structure, design, page layout and functionality as you will see in the following chapters.

Part

Managing content

3 Managing content

3.1 User interface overview

Click the **Sign in to CMS Desk** link at the top of the web site or go to <http://<domain>/<virtualdirectory>/cmsdesk>. You will be asked for user name and password.

Default user name and password

The default user name is **administrator** with **blank password**.

It's highly recommended that you change the password before you publish the web site on the live server.

Once you sign in, you will see a splash screen, giving you some basic information. Click the **Continue** button, you will be redirected to the following page:

The image shows a screenshot of the Kentico CMS Desktop interface. Several callout boxes with orange backgrounds and black text point to specific features:

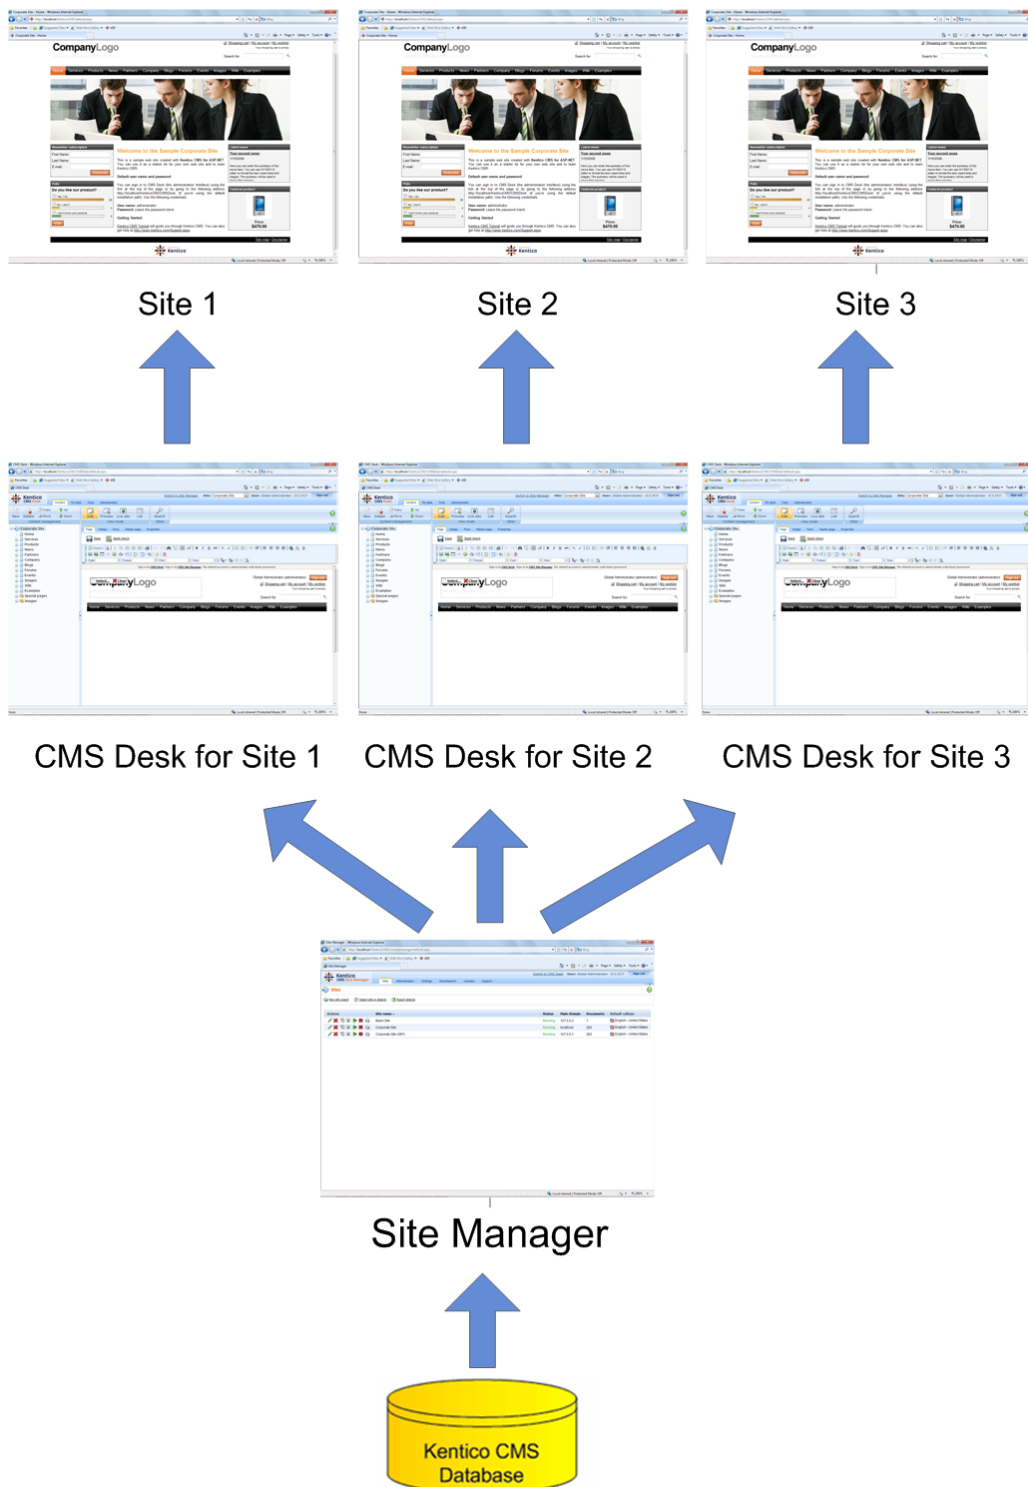

- Document actions:** Points to the top toolbar containing icons for New, Delete, Copy, Move, Up, and Down.
- Main menu:** Points to the top navigation bar with tabs for Content, My desk, Tools, and Administration.
- View mode selection:** Points to the 'View mode' section of the toolbar, which includes Edit, Preview, Live site, List, and Search buttons.
- Page editing mode:** Points to the 'Page' tab in the 'Page Form Properties' section.
- WYSIWYG editor:** Points to the main editing area, which includes a 'Save' button, a 'Spell check' button, and a rich text editor toolbar with various formatting options.
- Content tree:** Points to the left-hand sidebar showing a hierarchical tree of site pages and folders.
- Editable/viewing space:** Points to the main content area of the previewed page, which includes a header with 'CompanyLogo', a navigation menu, and a main content block with a list of services.

The user interface consists of the following main sections:

- **Main menu** with Content, My Desk, Tools and Administration sections.
- **Document actions** toolbar with buttons for creating new documents, deleting, copying, moving and sorting documents.
- **View mode** selection that allows you to choose between editing, preview, live view and list view.
- **Content tree** that represents the site map of the web site and allows you to organize the structure of documents and choose document that appears on the right side of the screen.
- **Page editing mode** - you can choose to edit page content, design the page template, edit the document fields, product properties or document properties.
- **Editing/viewing space** - here you can view/edit the document selected in the content tree in the mode selected in the view mode toolbar and in the page editing mode toolbar.

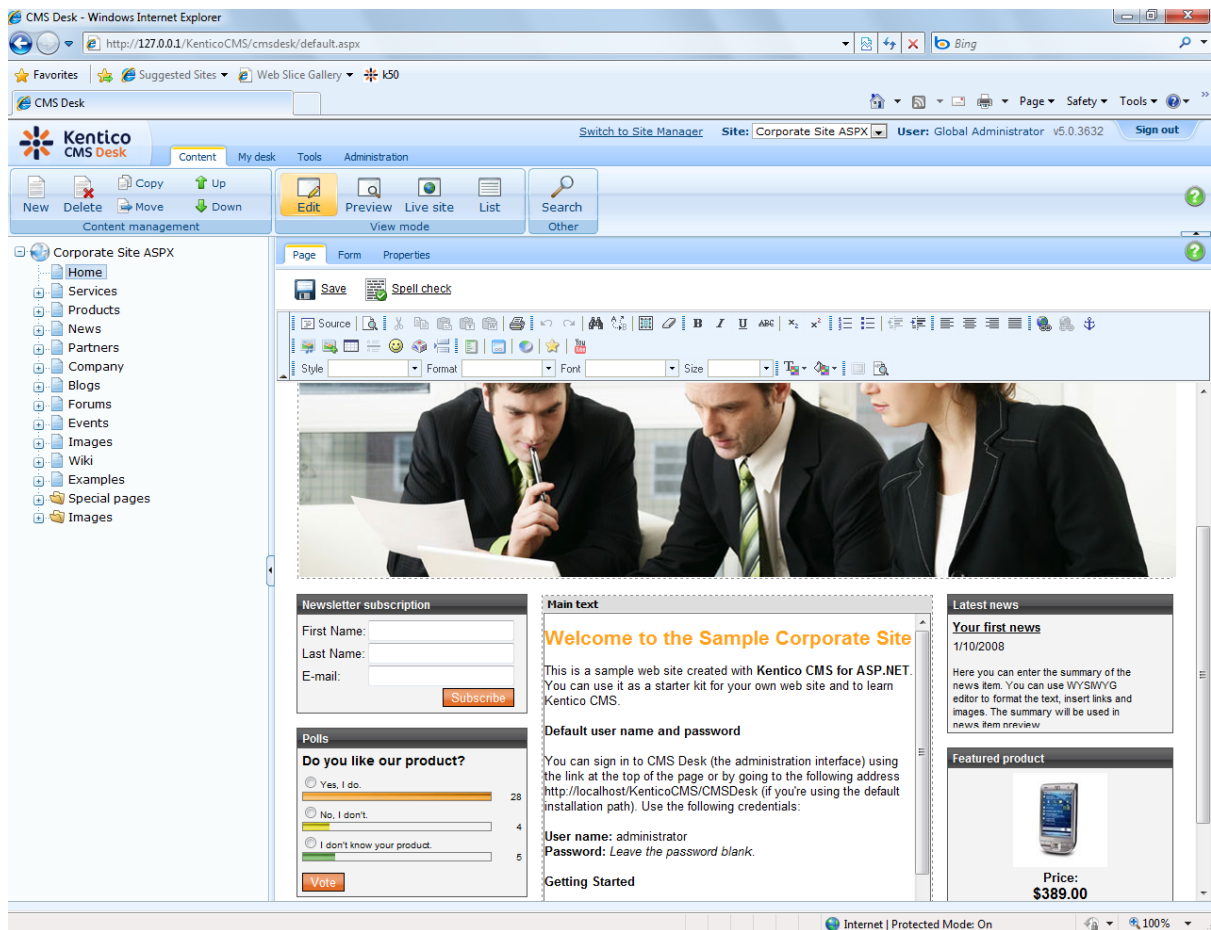

CMS Desk and Site Manager

CMS Desk allows content editors to edit content of a single web sites. Developers and site administrators who need to manage settings, code and configuration of all web sites, can use also the **Site Manager** interface. The Site Manager interface is accessible either through the <web project>/CMSiteManager URL or by clicking the **Switch to Site Manager** link at the top of the CMS Desk user interface. The following figure shows how the database, Site Manager, CMS Desk and web sites are related:

3.2 Editing home page content

Now we will modify the home page content. Click **Home** in the content tree. You will see a page like this on the right side:

The page is now displayed in the editing mode with editable region. Delete all content from the editable region and enter the following text:

This is my first text.

You can then use the WYSIWYG editor toolbar at the top of the page to change the formatting of the text like this:

*This is my **first** text.*

Click the **Save** button at the top of the page or press **CTRL+S** to save the changes.

Now click the **Live site** button in the main toolbar. You will see the modified version of the home page as it's displayed to the site visitors.

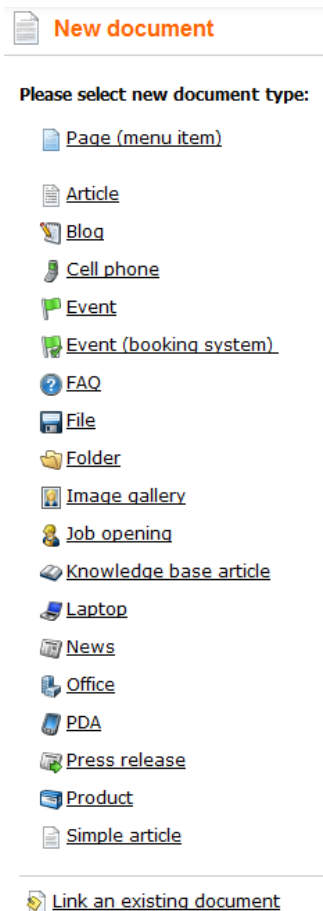

Preview mode

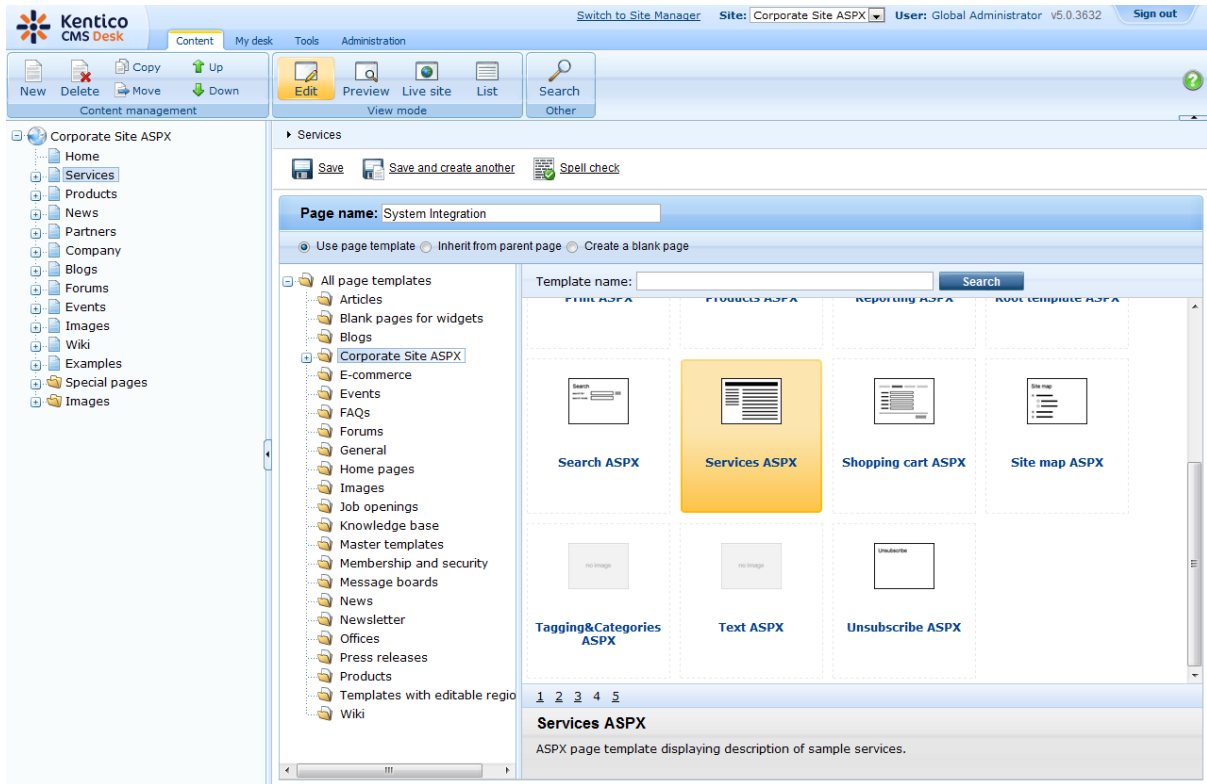

If you click the **Preview** mode now, it will display the same content as the **Live site** mode. It works as a preview mode only if you set up workflow. Then, you can preview the latest modifications before they are published.

3.3 Creating a new page

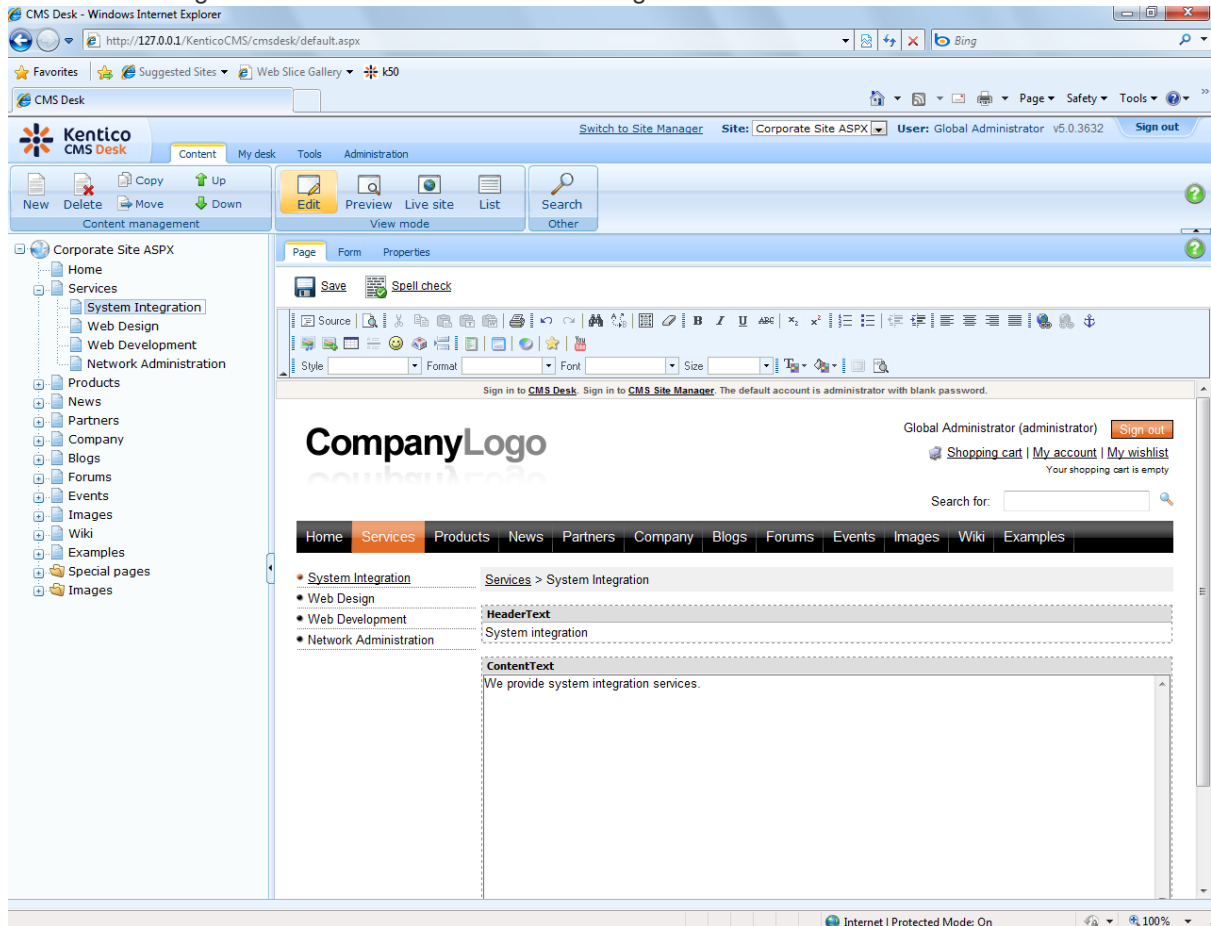

Now we will create a new page under the Services section. Click **Edit** in main toolbar to switch back to the editing mode. Click **Services** in the content tree. Click **New** in the main toolbar. You will see the following dialog that allows you to select the type of the document you want to create under the currently selected document:

Click the **Page (menu item)** button. You will be redirected to the new page properties dialog. Enter *System Integration* in the **Page name** field and choose the **CorporateSite ASPX/Services ASPX** template:

Click **Save** to create the new page. The page is now created in the content tree and you can edit page content on the right. Enter some text in the editable regions and click **Save**.

Now you may want to change the order of the items in the left menu. Click the **Down** button in the main toolbar three times. The *System Integration* item is moved at the bottom of the section:

Click **Live site** in the main toolbar. You will see your new page as it is displayed to site visitors. Please note that the **System Integration** item is placed at the end of the left menu as you specified:

You have learned how to create a new page based on a pre-defined page template.

3.4 Inserting an image

Now we will upload and insert a new image to our new page. Click **Services -> System Integration** in the content tree. Switch to the **Edit -> Page** mode. Place the cursor into the main editable region, just below the text, and click the **Quickly insert image** (🖼️) in the WYSIWYG editor toolbar.

The browser's Choose file dialog opens. Locate some suitable image file and click **Open**.

The image will be pasted to the editable region so that the page looks like this:

The screenshot displays the Kentico CMS Desk interface. On the left, a tree view shows the site structure under 'Corporate Site ASPX', with 'System Integration' selected. The main editor area features a navigation menu with 'Services' highlighted, a list of services including 'System Integration', 'Web Design', 'Web Development', and 'Network Administration', and a content area with 'HeaderText' and 'ContentText' sections. The 'ContentText' section contains the text 'We provide system integration services.' and an image of a computer monitor and keyboard.

Click **Save** to save the changes. Click **Live site** to see the new version of your page.

You have learned how to upload an image and insert it into the text.

Allowing pop-ups for the web site

If you're using a pop-up blocker, you may need to allow pop-up windows in your browser so that the Web part properties dialog as well as some other dialogs work correctly. This applies only to the administration interface, so the site visitors are not affected by this.

3.5 Creating a link

Now we will create a link between the **Services** page and our **System Integration** page. Click **Services** in the content tree and make sure you have the **Edit -> Page** mode selected.

Add a new item in the bulleted list called **System integration**:

Services

Our Services

We provide professional services in the following areas:

- [Web development](#)
- [Web design](#)
- [Network administration](#)
- System integration

This is a simple page with left menu and content on the right. You can create links similar to those above using the Insert/Edit Link button in the editor toolbar.

Select the whole line:

Services

Our Services

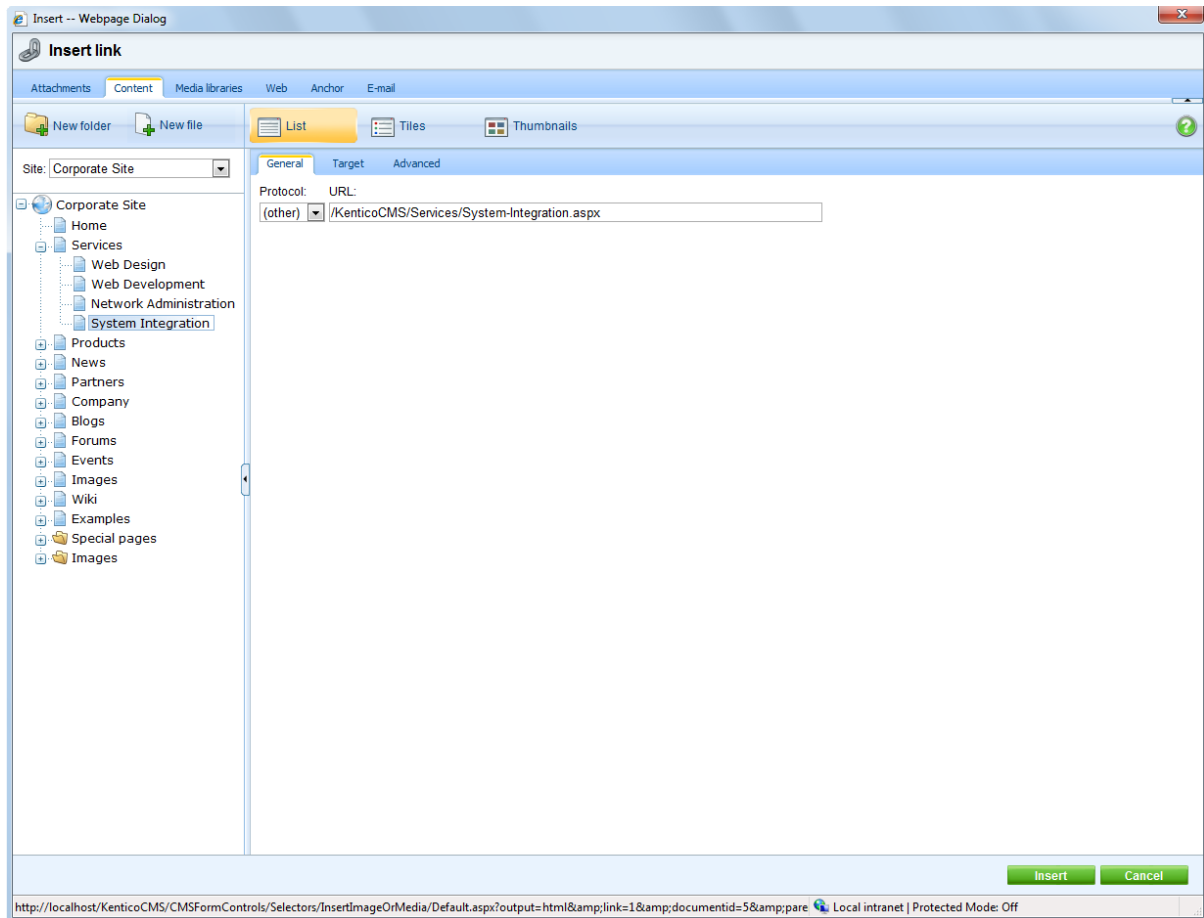

We provide professional services in the following areas:

- [Web development](#)
- [Web design](#)
- [Network administration](#)
- [System integration](#)

This is a simple page with left menu and content on the right. You can create links similar to those above using the Insert/Edit Link button in the editor toolbar.

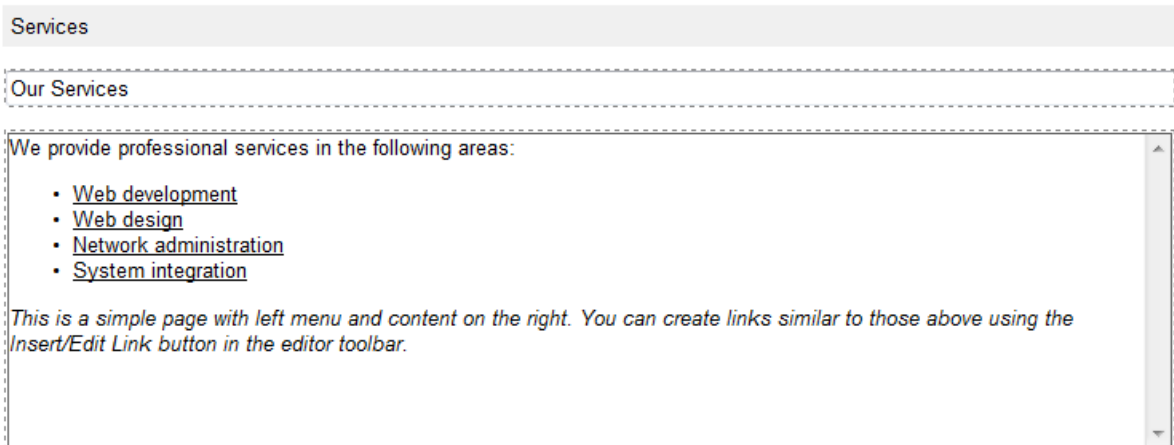

And click the **Insert/Edit Link** () button in the WYSIWYG editor toolbar.

The **Insert link** dialog opens.

Switch to the **Content** tab, select the **Services -> System Integration** page from the content tree and click **Insert**.

The text is now marked as a link:

The screenshot shows a web page editor interface. At the top, there is a grey header bar with the text "Services". Below it is a dashed border containing the text "Our Services". The main content area is a larger dashed border containing the text "We provide professional services in the following areas:" followed by a bulleted list of links: "Web development", "Web design", "Network administration", and "System integration". Below the list is a paragraph of text: "This is a simple page with left menu and content on the right. You can create links similar to those above using the Insert/Edit Link button in the editor toolbar." A vertical scrollbar is visible on the right side of the content area.

Click **Save** and choose the **Live site** mode. When you click the **System integration** link now, you're redirected to the new page.

You have learned how to create a link between pages.

3.6 Creating a news item

Now you will learn how to create a news item. Click **Edit** in the main toolbar. Click **News** in the content tree and click **New**. Choose to create a new document of type **News**. You are redirected to the form that allows you to define news item sections: title, summary, full text and release date. Enter the following text:

- **News title:** My first news
- **Release date:** *click Now*
- **News summary:** Some summary text.
- **News text:** Some news text.

Click **Save** to save the new document.

The screenshot displays the Kentico CMS Desk interface. The top navigation bar includes 'Content', 'My desk', 'Tools', and 'Administration'. The main toolbar contains 'New', 'Delete', 'Copy', 'Up', 'Move', 'Down', 'Edit', 'Preview', 'Live site', 'List', and 'Search'. The left sidebar shows a content tree with 'Corporate Site ASPX' expanded, containing folders like 'Home', 'Services', 'Products', 'News', 'Partners', 'Company', 'Blogs', 'Forums', 'Events', 'Images', 'Wiki', 'Examples', 'Special pages', and 'Images'. The 'News' folder is selected, and 'My first news' is highlighted. The main workspace shows the 'Form' tab active, with a 'Save' button and a 'Spell check' button. Below these are various editing tools and a rich text editor. The form fields are: 'News Title: My first news', 'Release Date: 12/11/2009' with a 'Now' button, 'News Summary: Some summary text', and 'News Text: Some news text'.

As you can see, the editing mode is now set to **Form** instead of **Page**. It means you do not edit the editable regions on the page, but you edit the structured data related to the document. The **Form** tab is used for editing the **structured data related to the document**. The document fields are fully customizable for every document type.

When you click **Live site**, you will see the news item displayed using a pre-defined transformation in both News and News -> My first news page:

You have learned how to add a news item and how to use the editing form for structured documents.

Page versus Form

There are two faces of document: content stored in editable regions on the page and data stored in form fields. The following table compares both approaches:

	Editable regions on the page	Form
Content structure	Simple content structure, only text content.	Complex content structure, typed data, such as text, date-time, numbers, etc.
Validation	Only basic validation rules for minimum and maximum length.	Complex validation rules, including regular expressions and custom form controls with custom validation code.
Display	The content is displayed in the context of the page as it is displayed in the editing mode.	The content is displayed using XSLT or ASCX transformations using special controls or web parts.
Storage	The content is stored in a single XML document in the document properties.	The content is stored in a separate database table. Each field has its own column. The data can be easily modified using SQL queries or API.
Examples of use.	<p>Home page, contact page.</p> <p>Generally: pages with simply structured or unstructured text-based content.</p> <p>The editable regions are usually used for documents of type Page (menu item).</p>	<p>News, product specification, event details, job opening, etc.</p> <p>Generally: pages with structured content where you need to separate content from design and keep the content in its original data type.</p> <p>The form-based content is usually used for documents of type News, Product, Article, etc.</p>

Part

IV

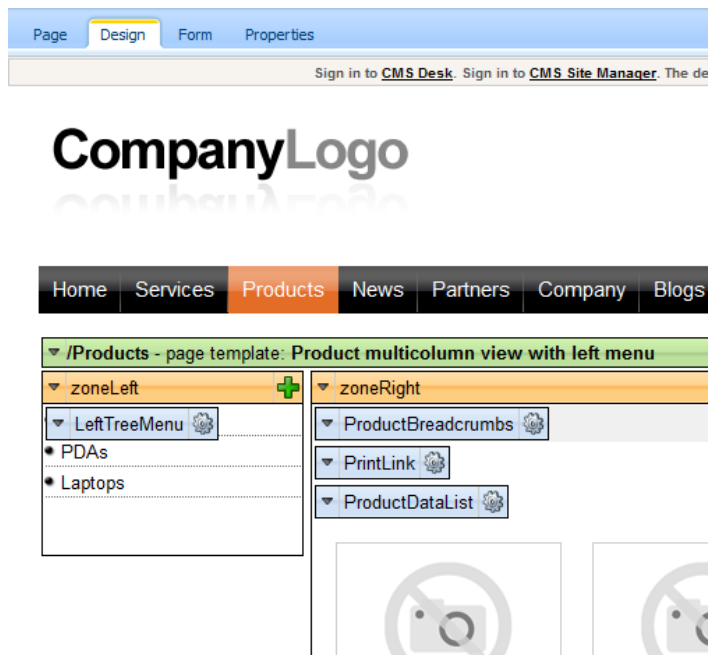

Site Development Overview

4 Site Development Overview

4.1 Site Development Overview

Kentico CMS provides two development models and you can choose which one suits you better:

- **Portal Engine** - this model allows you to build web site using a portal engine. It's the recommended way for most developers since it doesn't require programming and using Visual Studio. You can easily build web site using web parts in the **browser-based** user interface.

The following table compares both portal engine and ASPX templates:

	Portal Engine	ASPX Template
How you work	<p>You build web site using the browser-based interface.</p> <p>No programming knowledge is required for common tasks.</p>	<p>You build ASPX page templates that are used to display content from Kentico CMS.</p> <p>At least basic programming knowledge of ASP.NET and either C# or VB.NET is required.</p>
How you assemble pages	<p>You use built-in or custom web parts that you place into customizable page layouts.</p>	<p>You use built-in or custom ASP.NET server controls that are placed on the ASPX pages. These are standard ASPX pages and they are part of the web site project that you can open in Visual Studio.</p> <p>You can also place web parts (which are actually standard ASCX user controls) on the page templates if the functionality is not available as a server control.</p>
Master pages and visual inheritance	<p>Sub-pages inherit the content from the parent pages by default (so called "visual inheritance"). The inheritance can be optionally broken if you want to create a page without parent content.</p>	<p>All page templates (.ASPX pages) may use a master page, which is a standard ASP.NET 2.0 master page (.master page).</p> <p>The pages do not inherit content from their parents, they only inherit content from the master page (if it's used).</p>
Custom code integration and extensibility	<p>You can create your own user controls and web parts if you need to integrate a specific functionality.</p> <p>You can add any custom controls and code to the web parts or user controls that you use on your web site.</p> <p>You can also use standard ASPX pages within your portal engine-based web site.</p>	<p>You build standard ASPX pages with code-behind which means you can use any custom controls and code on the page in Visual Studio.</p>
Advantages	<ul style="list-style-type: none"> • Easier and faster way of building a web site. • ASP.NET programming knowledge is not required for common tasks. • You can build the whole web site very quickly, only using the web browser. 	<ul style="list-style-type: none"> • Standard ASP.NET architecture. • You can use your favorite development tools, such as Visual Studio for all changes.
Disadvantages	<ul style="list-style-type: none"> • Proprietary architecture and development. 	<ul style="list-style-type: none"> • Requires ASP.NET programming knowledge.

Is Kentico CMS just another portal engine?

Now you may ask what's the difference between Kentico CMS and DotNetNuke or SharePoint.

Well, the main difference is the **flexibility**. Kentico CMS gives you a full control over:

- site structure
- site navigation
- page layout
- design
- content structure

Also, it's important to explain that Kentico CMS is a **content management system**, not only a portal engine. It provides features of advanced CMS systems, such as:

- content repository with a logical tree hierarchy of documents
- content/design separation
- custom document types with custom fields
- workflow and versioning
- content locking (check-out, check-in)
- multilingual content
- content preview and content staging
- document-level permissions with permission inheritance
- full-text search in all content
- document management features for uploaded files

Moreover, Kentico CMS comes with many **professional and flexible built-in modules out-of-the-box**, including Newsletters, On-line forms, Forums, E-commerce, Content Staging, Image gallery, Event calendar, Booking system, Blogs, Polls and others

It means you do not need to purchase third-party modules with inconsistent user and programming interface, but you get everything from a single source, with a complete documentation.

The rest of this tutorial explains the ASPX templates approach. If you want to use the ASPX templates, please read the [Tutorial for ASPX page templates](#).

Part

Creating pages using ASPX templates

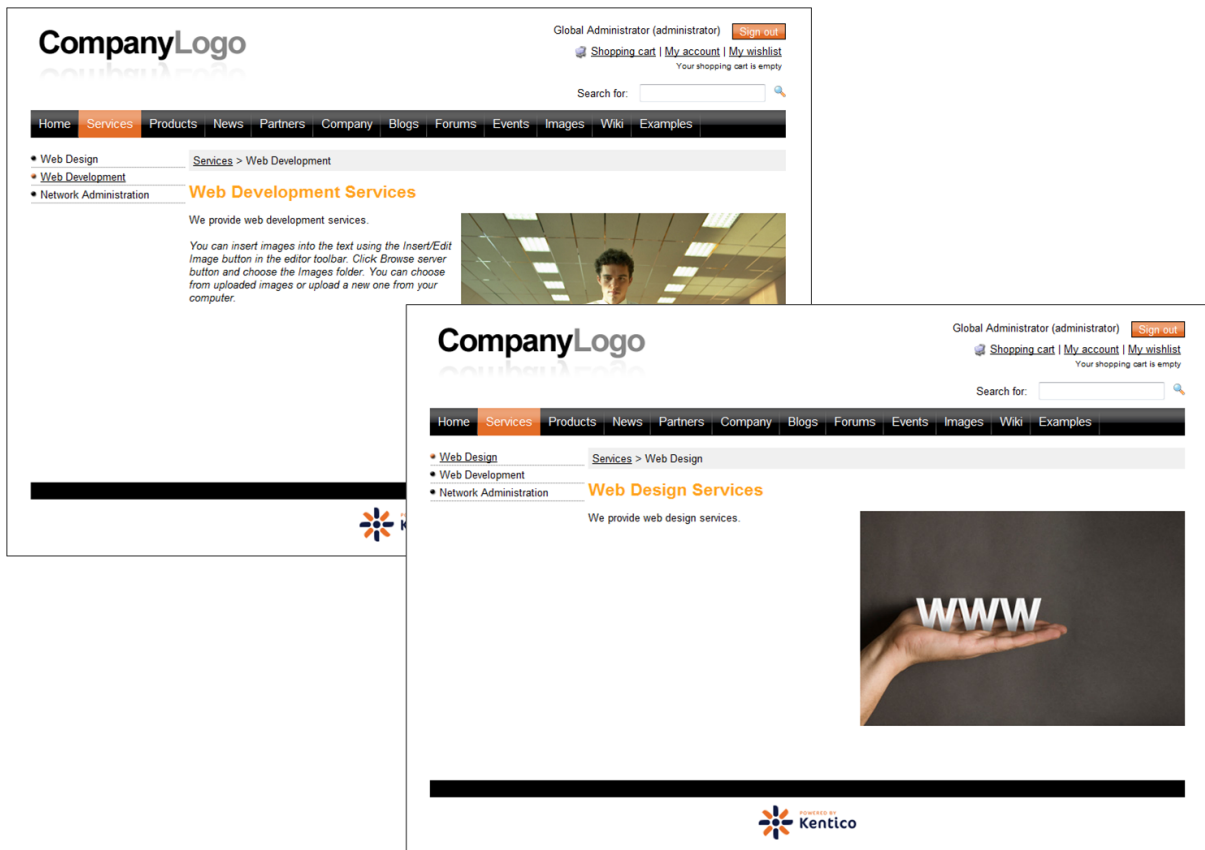

5 Creating pages using ASPX templates

5.1 ASPX page templates

If you're familiar with ASP.NET development in Visual Studio, you may choose to develop web sites using standard ASPX page templates. ASPX page templates in Kentico CMS are standard ASP.NET pages that display content from Kentico CMS. They receive the **aliasPath** URL parameter that tells the page template which page should be displayed.

What is a page template?

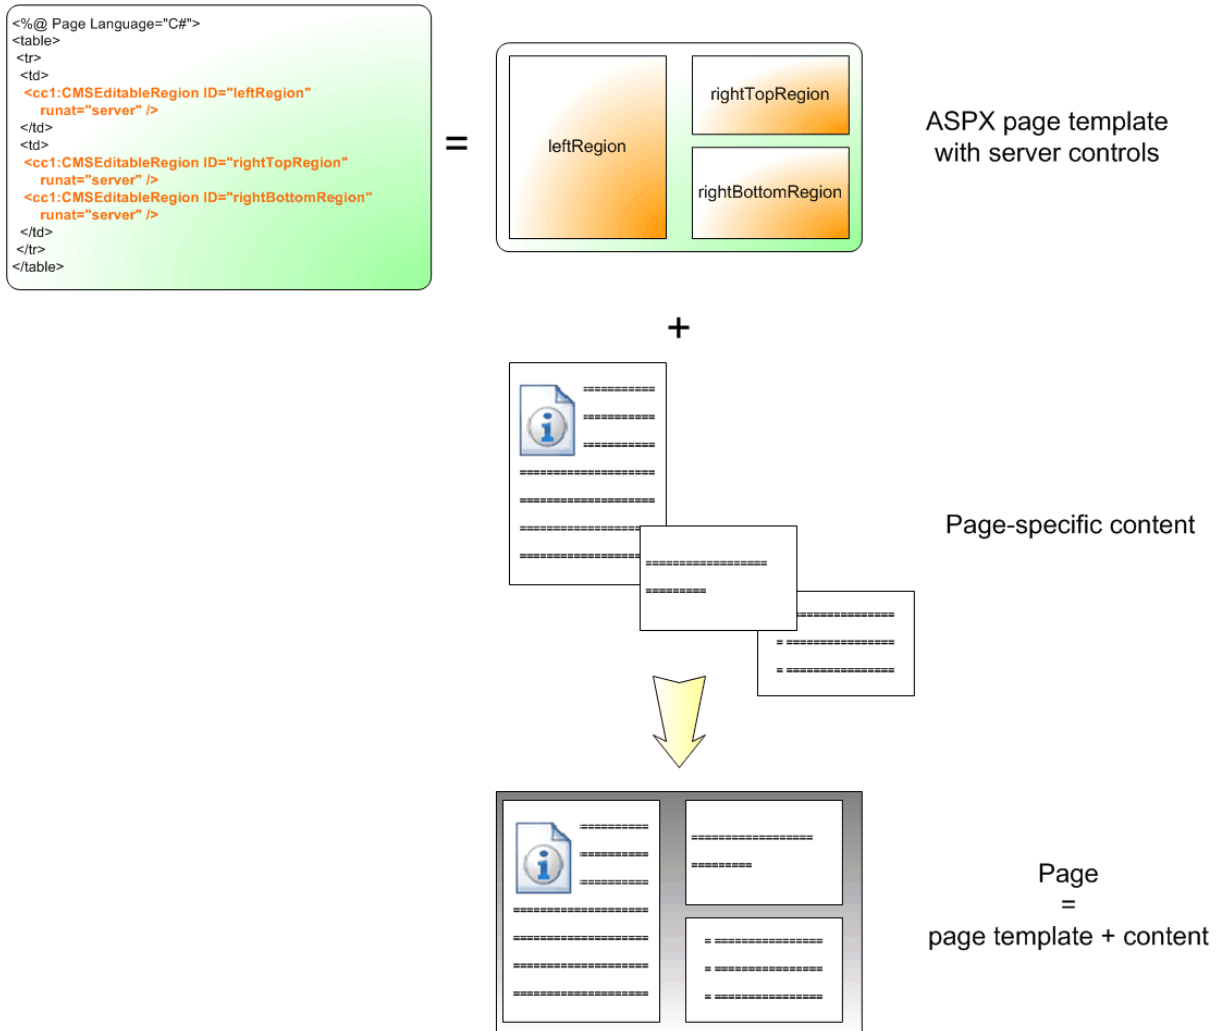

Every web page is based on some page template. The page template can be specific for a single web page ("ad hoc" page template) or it can be re-used for several pages. The following picture shows an example of two pages that use the same page template:

As you can see both of them use the same header, main menu, sub-menu, content structure and footer - they are based on the same **page template**. In this way, you can create multiple pages using the same design.

What does the ASPX page template consist of?

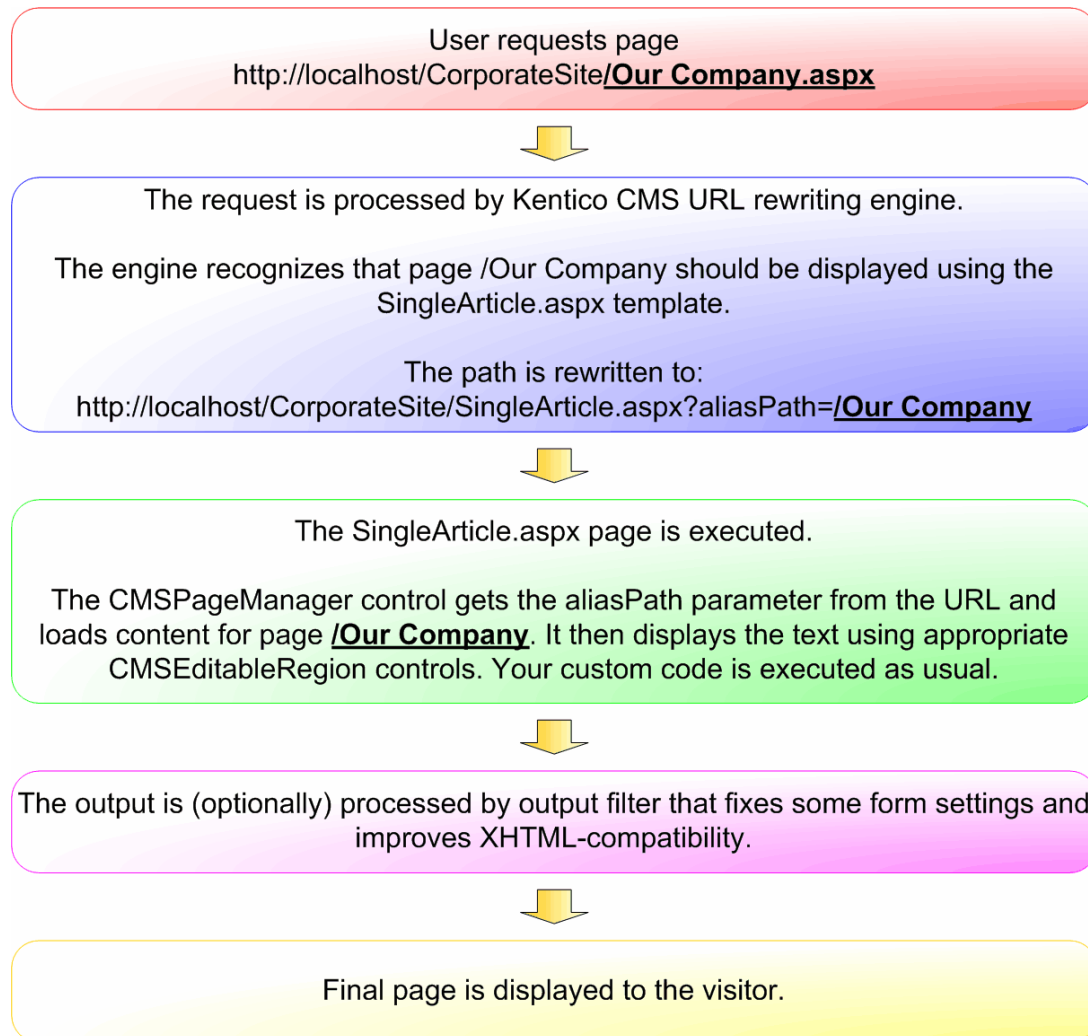

The page template is a combination of static HTML code and ASP.NET server controls (or user controls) that render dynamic content. The following figure illustrates how ASPX page template and page content are combined to display

As you can see, the ASPX page template is a standard page that may contain HTML code, CMS server controls and any other server control. You can also use code behind (in both VB.NET and C#) to modify page behavior and add custom functionality.

How is the ASPX page template processed?

When a user requests some page, such as /services/web-development.aspx, the system calls the assigned page template with the **aliasPath** parameter that specifies what content (which page) should be displayed using the given template:

The built-in Kentico CMS controls understand the aliasPath parameter in the URL and render the appropriate content automatically.

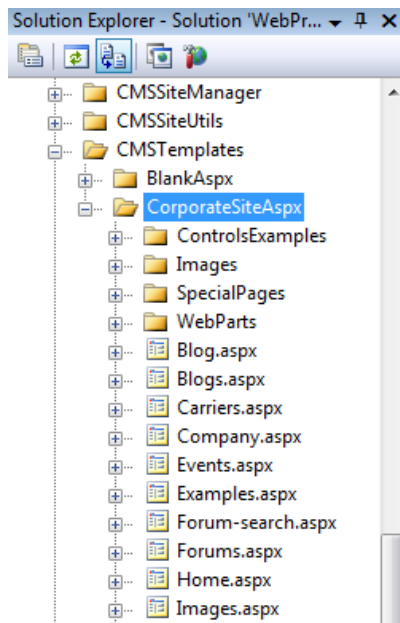

As you can see, the system uses a standard ASP.NET architecture. If you developed the web site without Kentico CMS, you would most likely use URLs like this: **/news.aspx?newsid=127** which is similar to **/news.aspx?aliaspath=/news/november news.aspx** URL used in Kentico CMS.

5.2 Creating a simple ASPX page template

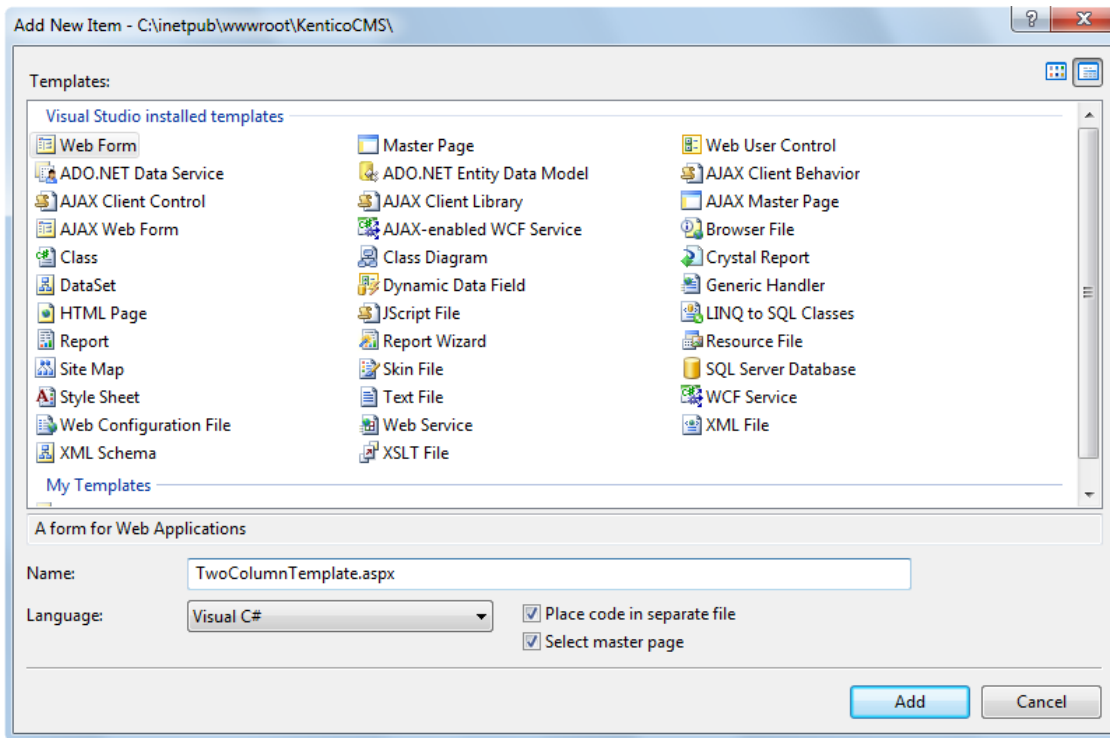

Now you will learn how to create a new ASPX page template. We will create a new **Contact** page with two columns that will contain editable regions.

Open the web project in Visual Studio. You can open it either using the WebProject.sln file or using the **File -> Open -> Web Site** menu.

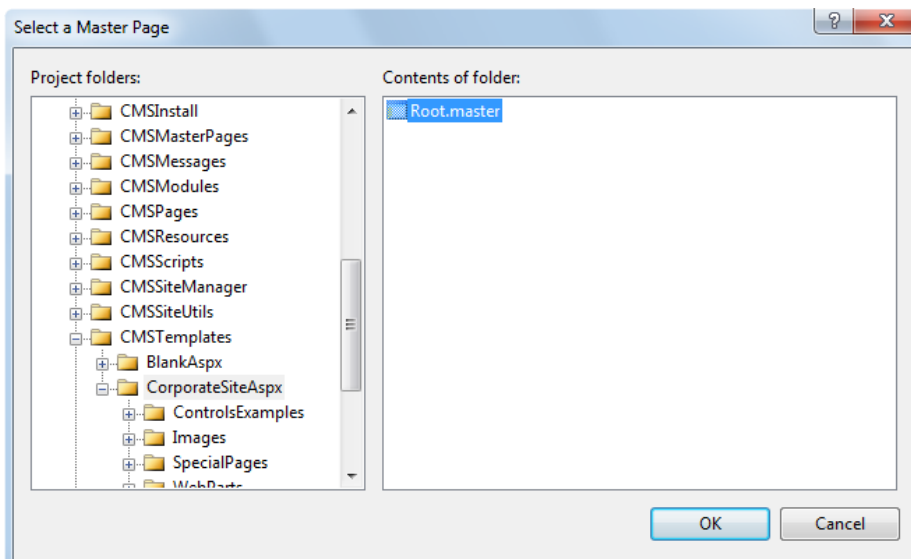

Now right-click the **CMSTemplates -> CorporateSiteASPX** folder in the Solution Explorer and choose **Add new item**:

Choose to create a new **web form** and call it **TwoColumnTemplate.aspx**, check the box **Select master page** and click **Add**.

Choose the master page **CMSTemplates/CorporateSiteASPX/root.master** and click **OK**.

Writing the ASPX code

Add the following code above the `<asp:Content>` element. It allows you to use Kentico CMS controls in your page:

```
<%@ Register Assembly="CMS.Controls" Namespace="CMS.Controls" TagPrefix="cc1" %>
```

Add the following code inside the `<asp:Content>` element:

```
<table width="100%">
<tr>
<td width="50%">
<cc1:CMSEditableRegion ID="txtLeft" runat="server" DialogHeight="400"
RegionType="HtmlEditor" RegionTitle="Left column" />
</td>
<td width="50%">
<cc1:CMSEditableRegion ID="txtText" runat="server" DialogHeight="400"
RegionType="HtmlEditor" RegionTitle="Right column" />
</td>
</tr>
</table>
```

The `<asp:Content>` control specifies that this content will be loaded into the master page (that is defined in the `MainMenu.master` file). As you can see, you can use the standard concept of master pages that is available in ASP.NET 2.0.

The `<cc1:CMSEditableRegion>` control defines an editable region that will be displayed as an HTML editor in the editing mode. On the live site, it ensures displaying of the page content.

Please note: this example uses a table layout. If you prefer CSS layout, you can simply replace the surrounding HTML code with `<DIV>` elements. As you can see, you have full control over the content.

Now we need to modify the code behind. Switch to code behind and add the following namespace so that the `CMSEditableRegion` can be recognized:

```
using CMS.UIControls;
```

The last step is to modify the class from which our page is inherited. Change the following code:

```
public partial class CMSTemplates_CorporateSiteASPX_TwoColumnTemplate : System.Web.UI.Page
```

to the following:

```
public partial class CMSTemplates_CorporateSiteASPX_TwoColumnTemplate : TemplatePage
```

so that the page can be used as a page template in Kentico CMS.

Registering the ASPX page as a page template

Now that we have created a new ASPX page, we need to register it in Kentico CMS as a page template, so that it can be used by content editors.

Sign in to **Site Manager** and go to **Development -> Page templates**. Click the **Corporate Site ASPX** folder and click **New template**. Enter the following values:

- **Template display name:** Two column template
- **Template code name:** TwoColumnTemplate

Click **OK**. Now enter the following value in the **File name** field:

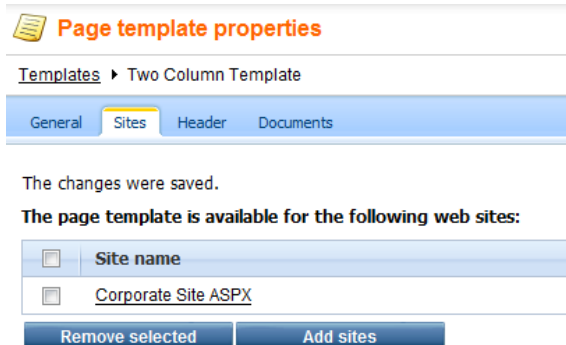

~/CMSTemplates/CorporateSiteASPX/twocolumntemplate.aspx

It is the virtual path of our ASPX page.

The screenshot displays the Kentico CMS Site Manager interface. The top navigation bar includes 'Sites', 'Administration', 'Settings', 'Development', 'Licenses', and 'Support'. The left sidebar shows a tree view under 'Development' with 'Page templates' selected. The main content area is titled 'Page templates' and shows a tree view of 'All page templates' with 'Corporate Site ASPX' expanded and 'Two Column Template' selected. The right pane shows the 'Page template properties' for 'Two Column Template', with fields for 'Template display name' (Two Column Template), 'Template code name' (TwoColumnTemplate), 'Category' (Corporate Site ASPX), and 'File name' (~/CMSTemplates/CorporateSiteASPX/tv). A 'Save' button is visible at the top of the properties pane.

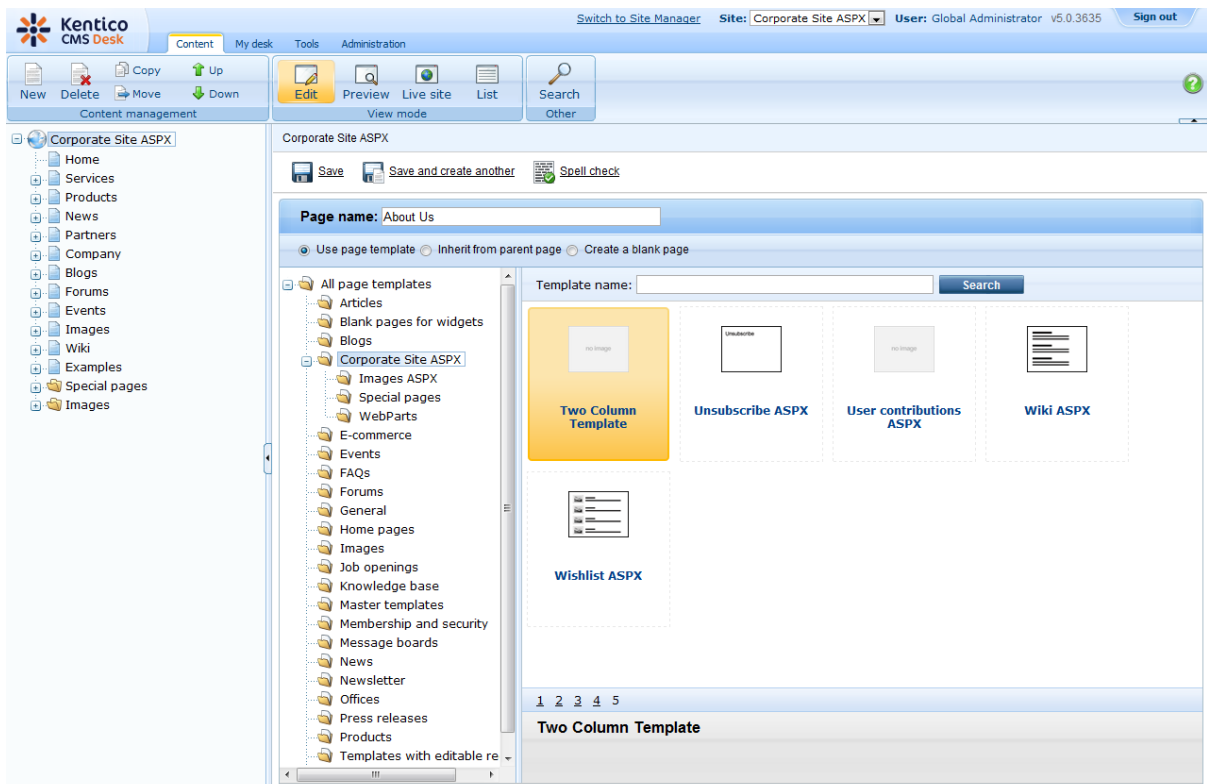

Save the changes.

Now click the **Sites** tab and click the **Add sites** button. Choose your site for the page template to get assigned to it.

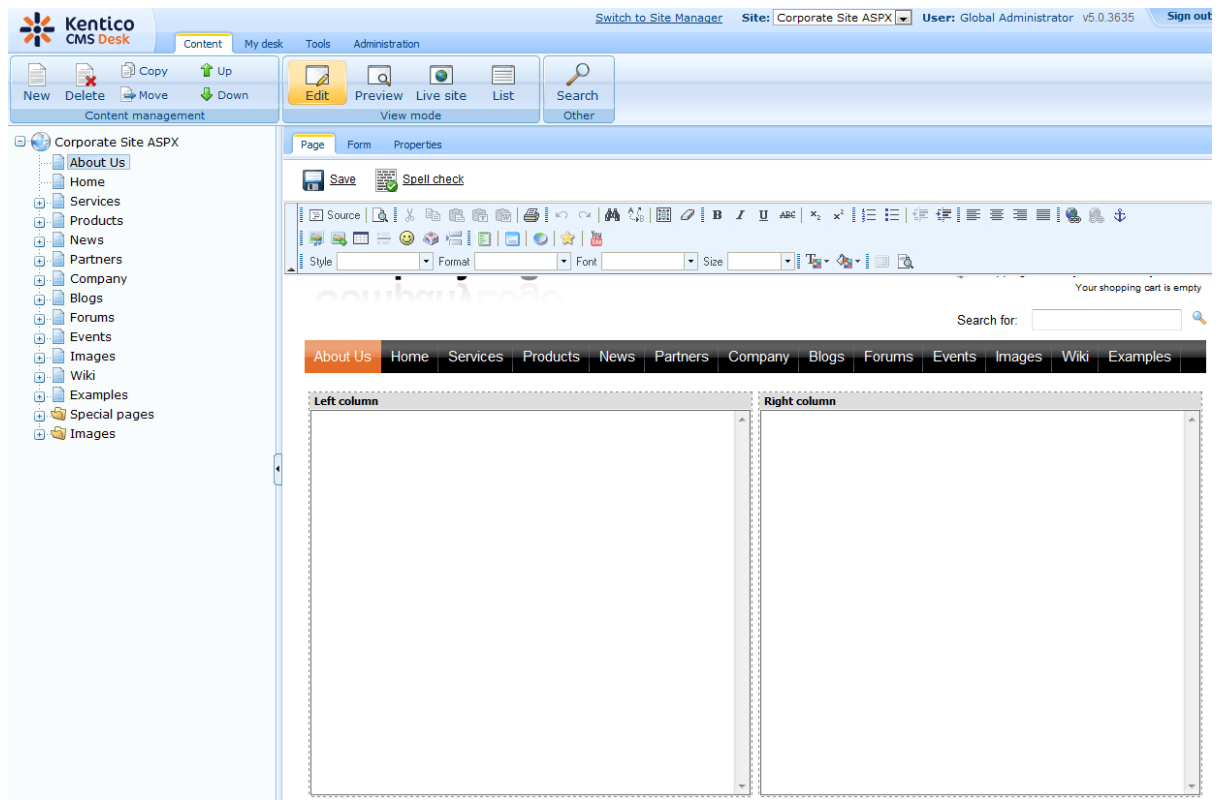

Creating an About Us page based on the new page template

Go to **CMS Desk -> Content**. Click the root of the content tree (Corporate Site ASPX) and click **New** in the main menu. Choose to create a new **Page (menu item)**. Enter the page name **About Us** and choose to create a page using the page template **Corporate Site ASPX/Two column template**:

Click **Save** to create the new page.

Click **Page** and you will see a page with editable regions like this:

Congratulations, you have just created your first page template based on ASPX page. Now you can enter some text and click **Save** to save the changes.

Please note

If you want to move the About Us page in another position in the menu, you can use the Up and Down arrows in the main toolbar to re-order the menu items.

5.3 Using the master pages

Kentico CMS allows you to use standard ASP.NET 2.0 master pages together with ASPX page templates. This is a very powerful concept, that allows you to share the same site header and footer with logo, main menu, search box, etc. over all pages without having to create these sections on each page template again and again.

The master pages are defined in files with extension **.master**. You can assign a single master page to each ASPX page. The master page must always contain the **ContentPlaceHolder** control like this:

```
<asp:ContentPlaceHolder ID="plcMain" runat="server">
```

The **ContentPlaceHolder** control specifies where the content of page templates should be loaded. So the master page typically contains the main logo and navigation and the content is displayed by ASPX pages loaded into the master page.

The following code sample defines a very simple master page:

```
<%@ Master Language="C#" AutoEventWireup="true" CodeFile="Root.master.cs"
Inherits="CMSTemplates_CorporateSiteASPX_Root" %>
<%@ Register Assembly="CMS.PortalControls" Namespace="CMS.PortalControls"
TagPrefix="cc2" %>
<%@ Register Assembly="CMS.Controls" Namespace="CMS.Controls" TagPrefix="cc1" %>
<%=DocType%>
<html xmlns="http://www.w3.org/1999/xhtml">
<head id="Head1" runat="server">
    <asp:literal runat="server" id="l1Tags" enableviewstate="false" />
</head>
<body class="<%=BodyClass%>" <%=BodyParameters%>>

    <form id="form1" runat="server">
        <cc1:CMSPageManager ID="CMSPageManager1" runat="server" />
        <cc1:CMSMenu ID="cmsmenu1" runat="server" CSSPrefix=";Sub" Cursor="Pointer"
            HighlightAllItemsInPath="true"
            Layout="Horizontal"
            Padding="0"
            Spacing="1" />
        <asp:ContentPlaceHolder ID="plcMain" runat="server">
        </asp:ContentPlaceHolder>
    </form>
</body>

</html>
```

The **CMSPageManager** control ensures loading of the content from the database into the editable regions. The **CMSMenu** control displays a drop-down menu. The **ContentPlaceHolder** control defines where the content of sub-pages should be loaded.

In case that you are planning to use AJAX components on your site, you need to add the **ScriptManager** control after the CMSPageManager control.

```
<asp:ScriptManager ID="manScript" runat="server" />
```

We use CMSMenu and CMSPageManager controls on the page template, so we need to add the **CMS.UIControls** namespace in code behind:

[C#]

```
using CMS.UIControls;
```

[VB.NET]

```
Imports CMS.UIControls
```

The master page must be inherited from the TemplateMasterPage, so the class definition must look like this:

[C#]

```
public partial class CMSTemplates_CorporateSiteASPX_Root : TemplateMasterPage
```

[VB.NET]

```
Partial Class CMSTemplates_CorporateSiteASPX_Root  
    Inherits TemplateMasterPage
```

And you also need do put the following code to the master page code-behind class:

[C#]

```
protected override void CreateChildControls()
{
    base.CreateChildControls();

    this.PageManager = this.CMSPageManager1;
}

protected override void OnPreRender(EventArgs e)
{
    base.OnPreRender(e);

    this.ltlTags.Text = this.HeaderTags;
}
```

[VB.NET]

```
Protected Overloads Overrides Sub CreateChildControls()
    MyBase.CreateChildControls()

    Me.PageManager = Me.CMSPageManager1
End Sub

Protected Overloads Overrides Sub OnPreRender(ByVal e As EventArgs)
    MyBase.OnPreRender(e)

    Me.ltlTags.Text = Me.HeaderTags
End Sub
```

You should store master pages in the **CMSTemplates** folder together with page templates, so that they are exported with your web site.

Part

VI

Managing styles and design

6 Managing styles and design

6.1 CSS styles

The design of the web site relies on standard CSS styles. Each web site has its global CSS stylesheet that can be chosen in **Site Manager -> Sites -> ... edit site ... -> General**. Here you can also choose a different CSS stylesheet used by WYSIWYG editors.

Besides, each page can overwrite the global CSS stylesheet by setting its own stylesheet in **CMS Desk -> Content -> ... edit some document ... -> Properties -> General**.

The CSS stylesheets can be managed in Site Manager. When you're in CMS Desk, you can easily switch to Site Manager by clicking the **Switch to Site Manager** link in the header:

Then click **Development** in the **Site Manager** main menu and click **CSS stylesheets** in the left menu:

Edit  the **Corporate Site** stylesheet:

 **CSS stylesheet properties**

CSS stylesheets ▶ Corporate Site

General Sites

 Save  Check out

Check out the stylesheet to file `c:\inetpub\wwwroot\KenticoCMS\CMSCSSStylesheets\CorporateSite.css` to edit the stylesheet externally.

Stylesheet display name:

Stylesheet code name:

Stylesheet text:

```

/**Global**/
.LTR, .RTL
{
    background-color: #ffffff;
}

body
{
    background-color: #ffffff;
    font-size: small;
    font-family: Arial;
    margin: 0px;
}

h1
{
    color: #ffa21e;
    font-size: 160%;
}

h2
{
    font-size: 130%
    
```

- Abuse report
- Blog
- Board
- Containers
 - Black box
 - Content padding
 - Gray box
 - Orange box
 - Orange box with grey color
- Content rating
- Ecommerce
- Events
- Examples
 - Change password
 - Drop down menu
 - Event manager
 - Media Libraries
 - My profile
 - Pager control
 - Report
 - Vertical css menu
- Forum
 - Attachments
 - Extended actions

Example:

Change the background color of the `.LTR, .RTL` style to `#fef3b8`, click **OK** to save the changes. Switch back to **CMS Desk** and see the live site. The site background will be yellow.

Please note: you may need to right-click the page and choose Refresh (in Internet Explorer) in order to see the latest version of the style.

.LTR, .RTL and body CSS classes

The `.LTR` and `.RTL` CSS classes are assigned to the `BODY` element for the left-to-right and right-to-left text direction respectively. You can use them to set the styles of the `BODY` element used on the live site without setting the `BODY` element in the WYSIWYG editor. It's useful if you need to set a dark background to the web site, but use a white background in the WYSIWYG editor text.

The `body` CSS class is applied to `BODY` element in both web site and WYSIWYG editor.

Browser-dependant styles

The BODY element CSS class consists of the combination of LTR/RTL style (see the box above) and the browser version. It looks like this:

```
<body class="LTR IE7" >
```

This feature allows you to create styles that depend on the browser version. So if you define the styles like this:

```
.IE6 .MyClass  
{  
  height: 20px ;  
}  
.Opera .MyClass  
{  
  height: 18px ;  
}
```

the font size will be different for IE6 and Opera.

The class names are:

- IE: IE<major version>
- Opera: Opera
- Firefox: Gecko
- Safari: Safari

6.2 App themes

In some cases, you may leverage the built-in support for ASP.NET themes. You can use them for setting styles of controls that do not have their own CSS class name, such as Datagrid, Calendar or web parts with complex dialogs (logon form, registration form, ...).

The name of the theme folder under **App_Themes** must be same as the code name of the site's CSS stylesheet. So if you use the **Green** stylesheet on your site, your theme must be stored in the **App_Themes\green** sub-folder under your web project.

You need to add your skins to the default.skin file. Here's an example of CMSCalendar / Calendar web part skin:

```
<cms:CMSCalendar SkinID="EventCalendar" Runat="server">  
  <NextPrevStyle ForeColor="Red"></NextPrevStyle>  
  <WeekendDayStyle BackColor="#E0E0E0"></WeekendDayStyle>  
</cms:CMSCalendar>
```

The code above defines the look of the Event calendar control. You can see this control on the Events page in the sample Corporate Site.

Where should I store web site design files?

It's recommended that you store all images or Flash movies that are part of the web site design template in folder `app_themes/<stylesheet code name>`. This ensures that the files are exported together with web site when your deploying it to some other server.

6.3 Menu design

Now you will learn how to change the design of the main menu. The main menu used in the sample Corporate Site is displayed using the **Drop-down menu** web part which is based on the **CMSMenu** server control.

The menu design depends primarily on the CSS styles. Here's an example of the CSS styles for the drop-down menu:

```
.horizontalmenu{
    background: #000 url(../App_Themes/CorporateSite/Images/topMenuBackground.gif);
}

.horizontalCMSMenu
{
    height: 34px;
    color: #fff;
    padding: 3px;
    background: #000 url(../App_Themes/CorporateSite/Images/topMenuBackground.gif);
}

.horizontalsubCMSMenu
{
    background: black;
    color: #fff;
}

.horizontalsubCMSMenu tr
{
    background: black;
}

.horizontalsubCMSMenuItem
{
    white-space: no-wrap;
    display: block;
}

...
```

As you can see these are standard CSS styles. You can modify the styles in the global CSS stylesheet of the given site.

The default menu looks like this:

Now we will change the background color of selected menu items to orange. Go to **Site Manager -> Development -> CSS stylesheets** and edit the **Corporate Site** stylesheet. Choose **Top menu styles -> Horizontal** in the right navigation panel. Change the highlighted line:

```
.horizontalCMSMenuItemMouseOver, .horizontalCMSMenuHighlightedMenuItem,
.horizontalCMSMenuHighlightedMenuItemMouseOver,
.horizontalCMSMenuHighlightedMenuItemMouseDown
{
    background: orange;
}
```

Click **OK** to save changes. When go to the live site now, you will see a menu like this:

Defining different styles for different menu levels

When you mouse-over the menu you will see that the sub-menus are displayed in different colors:

The sub-menu styles can be configured using the **CSS prefix** property of the **Drop-down menu** web part or the CSSPrefix property of the CMSMenu control.

In the sample Corporate Site project, the property is set to "horizontal;horizontalsub". It means that the CSS styles for the first level of the menu use styles like horizontalCMSMenuItem, while the sub-menus on the second and further levels are displayed using the CSS styles with prefix horizontalSub, such as horizontalSubCMSMenuItem. In this way, you can define different CSS styles for any level of the menu structure.

Defining the style of a single menu item

Every document may have its own style that is used when the document is displayed in the menu. We will try to modify the style of the **Home** menu item. Go to **CMS Desk -> Content** and click **Home**. Click **Properties -> Menu**. Here you can define:

- **Menu caption** - the name of the document when it's displayed in the menu.
- **Show in navigation** - indicates if the document should be displayed in the navigation controls
- **Show in site map** - indicates if the document should be displayed in the site map
- **Menu item design** for standard, mouse-overed and highlighted menu item.

Enter the following value into the **Menu item style** value (under the Menu item design section): background-color: red; and click **Save**. Click **Live site**. Click **Services**. The **Home** menu item is now displayed in red:

Part

VII

Creating a new site using ASPX templates

7 Creating a new site using ASPX templates

7.1 Overview

This tutorial will guide you through the creation of a simple web site using ASPX page templates developed in Visual Studio. You will learn how to define site structure, design, how to create your own pages and page templates.

During this tutorial, we will use a static web site template that is similar to what a developer gets from graphic designer. It looks like this:

You can find the static page template in folder C:\Program Files\Kentico CMS\<version>\CodeSamples\SampleWebTemplate. The template consists of the home.htm file, styles folder and app_themes folder with images.

7.2 Creating a new web site using wizard

The following chapters suppose you have previously installed a sample CorporateSite on your computer. We will leave the existing web site and add a new web site that will run on http://127.0.0.1.

Multiple sites and Visual Studio's built-in web server

If you're using the **built-in web server in Visual Studio instead of IIS**, you need to **stop the CorporateSite** site in the Site Manager -> Sites dialog first and then you can continue. Since the built-in web server doesn't support other domain than localhost, you

will use the **localhost domain** again.

Sign in as Administrator to **Site Manager** -> **Sites**. Click **New site wizard** on the home page.

The screenshot shows the Kentico CMS Site Manager interface. The top navigation bar includes the Kentico logo, "CMS Site Manager", and a "Switch to CMS Desk" link. The user is logged in as "User: Glot". The main menu has tabs for "Sites", "Administration", "Settings", "Development", "Licenses", and "Support". The "Sites" tab is active, showing a "New site wizard" button and links for "Import site or objects" and "Export objects". Below this is a table of existing sites:

Actions	Site name	Status	Main domain
      	Corporate Site	Running	localhost

In the first step, choose to **Use web site template**. Click **Next**.

The screenshot shows the "Step 1: Choose default web site" wizard screen. The title "Step 1" is in orange. The main heading is "Choose default web site". Below the heading is a paragraph: "If you choose to create a blank site, the wizard will guide you through the process of creating a new site. If you choose to use a template, you will be able to choose one of the predefined web site templates." There are two radio button options: "Create a new site using a wizard" (unselected) and "Use web site template" (selected). A green "Next >" button is located at the bottom right of the wizard area.

In the second step, choose the **Blank site ASPX** web site template: Click **Next**.

Step 2 | **Choose web site template**
Choose the predefined web site template that will be used for your new web site. The web site template may contain site structure, design, basic content, new document types and other settings.

	Community Site This is a web site template for a sample community site. Social networking features of Kentico CMS are used on the site to give you an idea of how they can be used on your web site. You can also modify this web site and use it as a base for the development of your own site. It uses the portal engine and is recommended for developers who are new to Kentico CMS.
	Blank Site This template is intended for developers who want to create a new web site from scratch. It uses the portal engine.
	Blank Site ASPX This template is intended for developers who want to create a new web site from scratch. It uses the ASPX page templates that require a higher level of .NET knowledge than the portal engine.

[< Previous](#) [Next >](#)

In the third step, enter the following details:

- **Site display name:** *My web site*
- **Site code name:** *mysite*
- **Domain:** *127.0.0.1* - if you're using Visual Studio's built-in web server, set the default value to **localhost**

Click **Next**.

Step 3

Enter new site settings
Enter the display name and code name of the web site. The Domain field must contain the domain that you will use to access the web site during development (you may change it when the site goes live). The default culture is the main language of the web site.

Site display name:

Site code name:

Domain name:

[< Previous](#) [Next >](#)

In the fourth step, you're asked to select objects which should be imported to your new site. Do not change anything and click **Next**.

Step 4 | **Objects selection**
Please select objects which should be imported.

All objects

- Web site
 - Documents
 - Tools
 - Administration
 - Settings
 - Development
- Global objects
 - Tools
 - Administration
 - Development

Import objects

Please note: The import process may overwrite your existing objects. The existing objects are marked with * and will be overwritten if checked.

Please select the object type from the tree if you wish to change the default selection. Click **Next** to start the import of selected objects.

Global selection

[Load default selection](#) [Select all objects](#) [Select only new objects](#) [Deselect all objects](#)

Import settings

- Assign all objects to the imported site (recommended)
- Run the site after import
- Delete incomplete site when import fails
- Import files (recommended)
- Do not import objects where parent object is missing
- Import tasks (recommended)

< Previous Next >

In the fifth step, the progress of objects import is displayed. Click **Next** after **Import has successfully finished** appears.

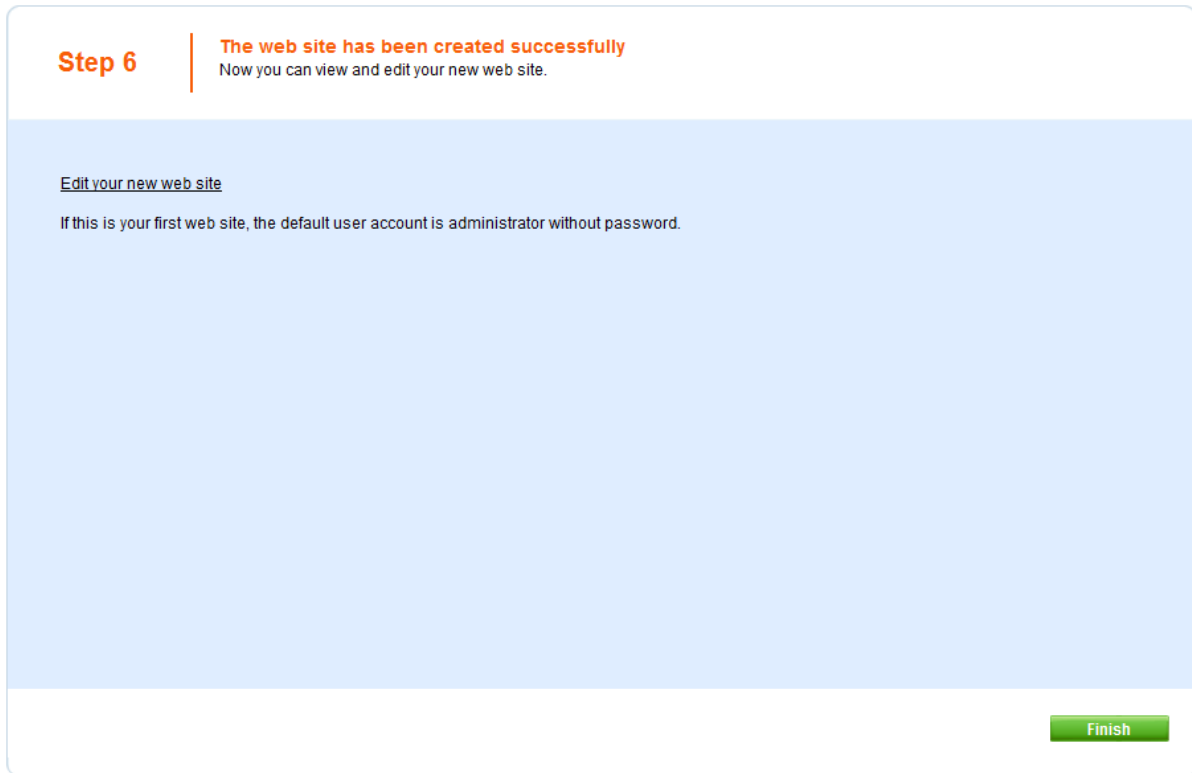

Step 5 | **Import progress**
Objects are being imported.

Importing 'Page templates' objects
Importing 'Page template categories' objects
Importing 'Settings' objects
Importing 'Settings categories' objects

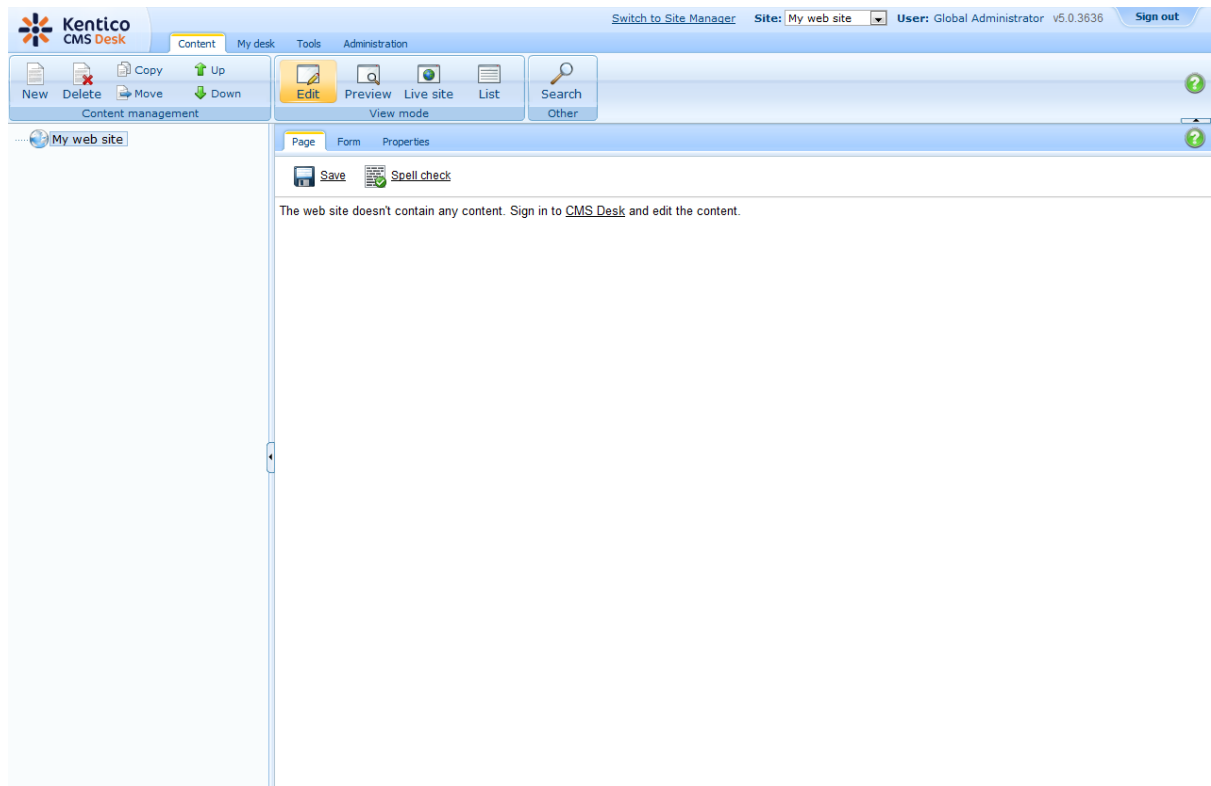

Objects are being imported

< Previous Cancel Next >

You will see the confirmation message.

Click the **Edit your new web site** link. A new window with Kentico CMS Desk opens at domain 127.0.0.1. You need to sign in again since the authentication is not shared over different domains. After you sign in, you will see your new, empty web site:

You have created the base for your new web site. In the next chapters, you will learn how to implement the required design.

7.3 Creating the CSS stylesheet

Before we start editing our new web site, we will prepare the CSS styles and images based on our web site template. Go to Site Manager -> Development -> CSS Stylesheets and click **New CSS stylesheet**. Enter the following values:

- Stylesheet display name: **My site stylesheet**
- Stylesheet code name: **MySite**
- Stylesheet text: copy and paste all text from the **SampleWebTemplate\Styles\main.css** file (you will find it in folder C:\Program Files\Kentico CMS\<version>\CodeSamples)

Click **OK**. Switch to the **Sites** tab, click **Add sites** and add the **My web site** into the list. It assigns the stylesheet to your web site.

The screenshot displays the Kentico CMS Site Manager interface. The top navigation bar includes the Kentico logo and the text "CMS Site Manager", along with tabs for "Sites", "Administration", "Settings", "Development" (which is active), "Licenses", and "Support".

On the left side, there is a "Development" menu with the following items: Categories, Countries, CSS stylesheets (highlighted), Cultures, Custom tables, Document types, E-mail templates, Form controls, Inline controls, Modules, Notifications, Page layouts, and Page templates.

The main content area is titled "CSS stylesheet properties" and shows the "My site stylesheet" selected under the "CSS stylesheets" category. There are two tabs: "General" and "Sites" (which is active). Below the tabs, a message states "The changes were saved." followed by the heading "The CSS stylesheet is available for the following web sites:". A table lists the following sites:

<input type="checkbox"/>	Site name
<input type="checkbox"/>	My web site

At the bottom of the table, there are two buttons: "Remove selected" and "Add sites".

Go to **Site Manager** -> **Sites** and edit properties of **My web site**. Select **My site stylesheet** in the Site CSS stylesheet drop-down list and click **OK**. It ensures that the stylesheet is used on all pages of your new web site.

Now copy the folder **SampleWebTemplate\app_themes\MySite** to **<web project>\app_themes**. It will ensure that the images are exported as a part of the web site if you decide to move the web site in future. Please note that the folder under app_themes must have the same name as the code name of the CSS stylesheet - **MySite**.

CSS stylesheet URL and relative paths

We have adjusted the image paths in the CSS stylesheet so that they match the target folders in your new web site. In real life, you will need to adjust the paths manually.

The URLs of images in the CSS stylesheets are always relative to the CSS stylesheet.

The URL of the CSS stylesheet is

```
<web project>/CMSPages/GetCSS.aspx?stylesheetname=MySite
```

which means, you need to link to files in the app_themes folder as

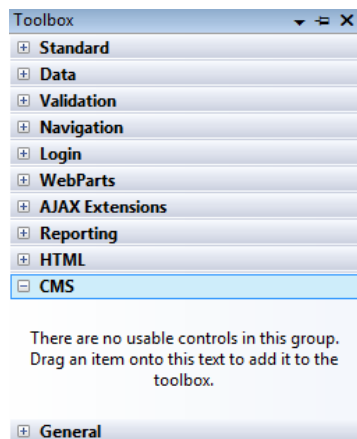

```
../app_themes/mysite/images/imagename.gif.
```

7.4 Opening and configuring the web project

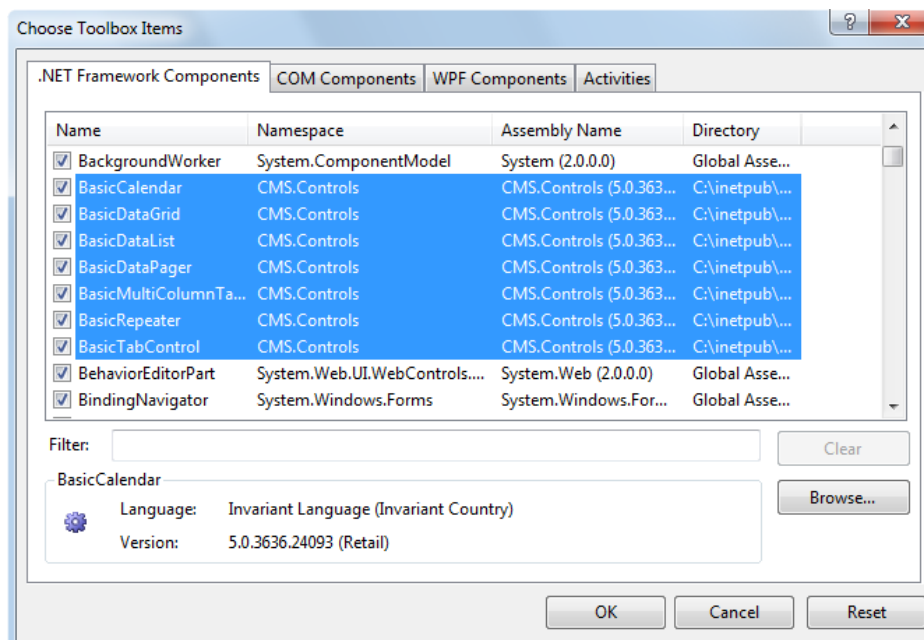

Open the web project in Visual Studio. You can open it either using the **WebProject.sln** file or using the **File -> Open -> Web Site** menu.

Now we need to add Kentico CMS Controls to the Visual Studio Toolbox.

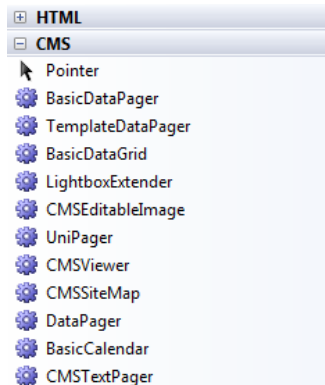

1. Open the web site project in Visual Studio and open some ASPX page.
2. Right-click the **Toolbox** and choose **Add tab** from the context menu.
3. Type the name of the new tab (e.g. CMS) and press Enter:

4. Right-click the new tab and choose **Choose items...** from the context menu.
5. In the **Choose Toolbox Items** dialog, click Browse and locate the **CMS.Controls.DLL** library in the **bin** folder under your web site. Click **Open** and then click **OK**.

6. The controls are now added to the Toolbox:

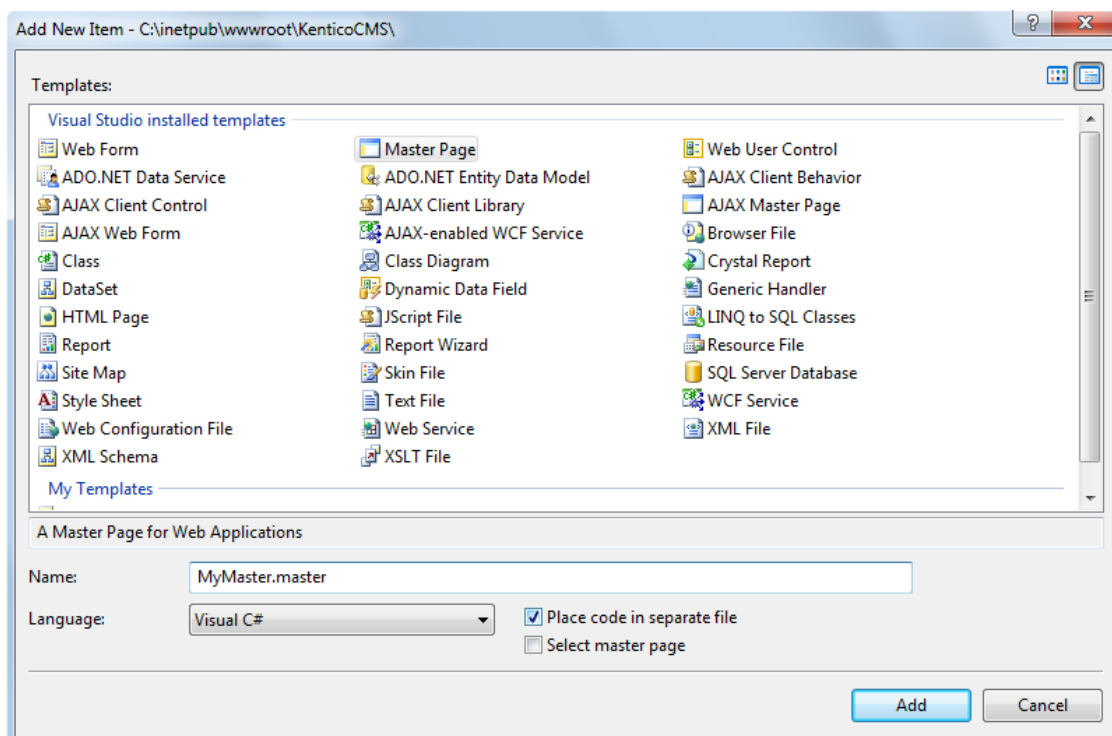

7. Now you can easily drag and drop the controls on your Web forms.

7.5 Master page

Open the web project in Visual Studio and right-click the **CMSTemplates** folder in the Solution Explorer window and create a new sub-folder **MySite**. Please note that the folder name must be same as the code name of your site.

Right-click the **MySite** folder and choose **Add new item...** Choose to create a new master page and set its name to **MyMaster.master**. If you're a VB developer, you may want to choose Visual Basic in the **Language** drop-down list.

Replace all default ASPX code from the master page (in the Source view) except of the first line with `<% @ Master %>` directive with the following code:

```
<%@ Register Assembly="CMS.PortalControls" Namespace="CMS.PortalControls" TagPrefix="cc2" %>
<%@ Register Assembly="CMS.Controls" Namespace="CMS.Controls" TagPrefix="cc1" %>
<%=DocType%>
<html xmlns="http://www.w3.org/1999/xhtml">
<head id="Head1" runat="server">
  <asp:literal runat="server" id="litTags" enableviewstate="false" />
</head>
<body class="<%=BodyClass%>" <%=BodyParameters%>>
  <form id="form1" runat="server">
    <cc1:CMSPageManager ID="CMSPageManager1" runat="server" />
  </form>
</body>
</html>
```

The **CMSPageManager** control ensures loading of content from the database into the page.

In case that you are planning to use AJAX components on your site, you need to add the **ScriptManager** control after the CMSPageManager control.

```
<asp:ScriptManager ID="manScript" runat="server" />
```

Switch to code behind and add the reference to the CMS.UIControls namespace:

[C#]

```
using CMS.UIControls;
```

[VB.NET]

```
Imports CMS.UIControls
```

Change the class definition so that the master page inherits from TemplateMasterPage:

[C#]

```
public partial class CMSTemplates_MySite_MyMaster : TemplateMasterPage
```

[VB.NET]

```
Partial Class CMSTemplates_MySite_MyMaster
  Inherits TemplateMasterPage
```

Add the following code after the Page_Load method and call both the CreateChildControls and the OnPreRender methods from the Page_Load method:

[C#]

```
protected override void CreateChildControls()
{
    base.CreateChildControls();

    this.PageManager = this.CMSPageManager1;
}

protected override void OnPreRender(EventArgs e)
{
    base.OnPreRender(e);

    this.ItlTags.Text = this.HeaderTags;
}
```

[VB.NET]

```
Protected Overloads Overrides Sub CreateChildControls()
    MyBase.CreateChildControls()

    Me.PageManager = Me.CMSPageManager1
End Sub

Protected Overloads Overrides Sub OnPreRender(ByVal e As EventArgs)
    MyBase.OnPreRender(e)

    Me.ItlTags.Text = Me.HeaderTags
End Sub
```

Now switch to the **Source mode** (HTML mode) copy and paste the HTML code from the sample **home.htm** file (inside <body></body> tags) after the <cc1:CMSPageManager /> control in the master page.

However, we need only the logo, main menu and footer. So we will replace the <!-- main content --> ... <!-- /main content --> section of the HTML code with the following code:

```
<asp:ContentPlaceHolder ID="plcMain" runat="server"></asp:ContentPlaceHolder>
```

This is a standard ASP.NET control that ensures loading of pages into the master page.

So the added code will look like this:

```
<div class="MainDiv">

<!-- logo -->
<br />
<div class="Logo">
  &nbsp;
</div>

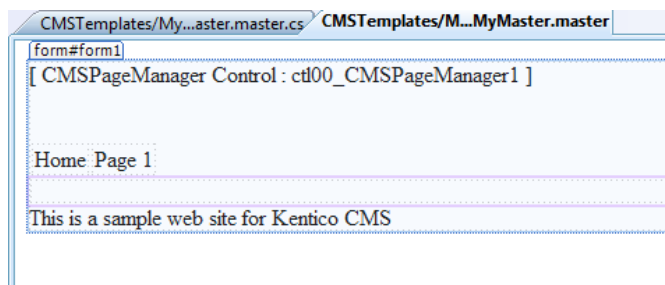

<!-- main menu -->
<div class="MainMenu">
  <table cellspacing="2" cellpadding="2" border="0">
    <tr>
      <td class="MainCMSMenuHighlightedMenuItem">Home</td>
      <td class="MainCMSMenuItem">Page 1</td>
    </tr>
  </table>
</div>

<!-- main content -->
<asp:ContentPlaceHolder ID="plcMain" runat="server"></asp:ContentPlaceHolder>
<!-- /main content -->

<!-- footer -->
<div class="Footer">
  This is a sample web site for Kentico CMS
</div>

</div>
```

When you switch to the **Design** tab, you should see a page preview like this:

Save the changes.

Using CSS-based layout instead of tables

If you prefer using CSS-based layout, you can easily change the HTML code here and replace the tables with DIV elements. We use table-based layout by default since it's easier to understand, although we are aware of advantages of the CSS-based layout.

7.6 Main menu

Now we will add a dynamic **drop-down menu** to our master page. The drop-down menu can be implemented either by CMSMenu or CMSListMenu control. The first option is easier to use if you're not familiar with complex CSS styles, so we will use it now.

Please note: If you prefer using a drop-down menu based on the CSS styles and UL/LI elements, you can try to use the CMSListMenu later (you can find more details and examples in Kentico CMS Controls Reference).

Switch to the **Source** mode of the **MyMaster.master** page and drag and drop the **CMSMenu** control inside the `<div class="MainMenu">` element. Remove the original `<table>` element used for the static menu. The main menu section will look like this:

```
<!-- main menu -->
<div class="MainMenu">
  <cc1:CMSMenu ID="CMSMenu1" runat="server" />
</div>
```

Now switch back to the **Design** tab and set the following properties of the CMSMenu control:

- **Path:** /%
- **Layout:** Horizontal
- **CSSPrefix:** ;sub
- **Cursor:** Pointer

The **Path** property value specifies that the menu should start from the root of the site structure.

The **Layout** property allows you to choose between vertical and horizontal menu.

The **CSSPrefix** property specifies the names of CSS styles for the top menu (standard style names) and for sub-menus (all style names are prefixed with **sub**).

The **Cursor** property specifies the type of cursor when the user mouse-overs the menu.

Save the changes.

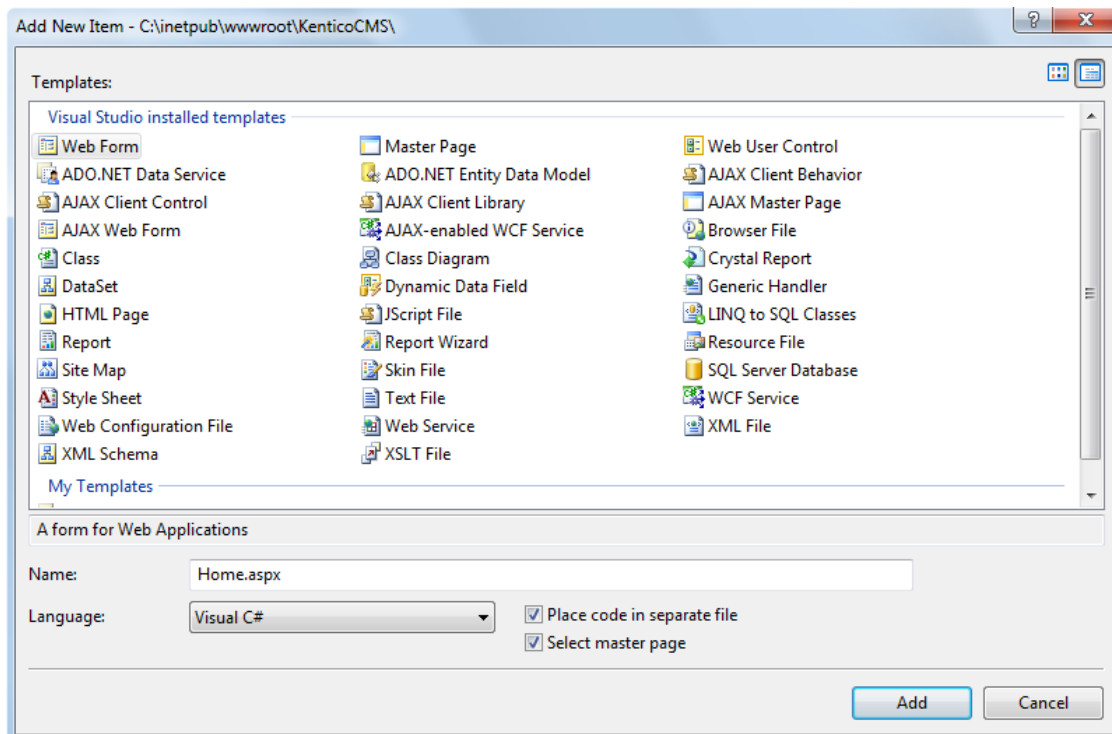

Kentico CMS Controls and Web Parts

While Kentico CMS is delivered with a set of flexible server controls in the CMS.Controls.dll library, lots of functionality is only available in the web parts that are stored in the **CMSWebParts** folders. These web parts are standard ASCX user controls and they can be used on both portal engine templates and on ASPX pages. You only need

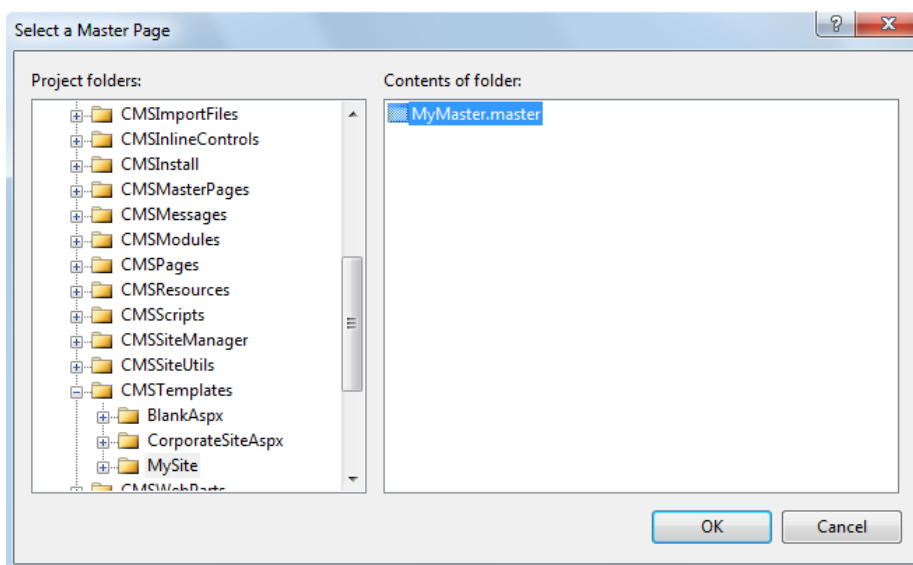

to drag and drop the web parts on your ASPX page and set their properties in the Properties window of Visual Studio. All CMS controls have a relevant web part as well.

7.7 Home page

Now we will change the home page template to our web site. Right-click the **CMSTemplates/MySite** folder in the **Solution Explorer** and click **Add new item...** Choose to create a new page called **Home.aspx** and check the box **Select master page**:

Click **Add** and choose the **MyMaster.master** page in the **CMSTemplates/MySite** folder in the next dialog:

Copy the whole `<!-- main content -->` section from the **home.htm** file inside the `<asp:Content>`

element. Now we will remove the text content with editable regions so that it can be managed by content editors:

- Remove the whole "Welcome to Our Business, Inc. Web Site..." text section.
- Remove the whole "Our Business, Inc. ..." content of the right box.

The complete code will look like this:

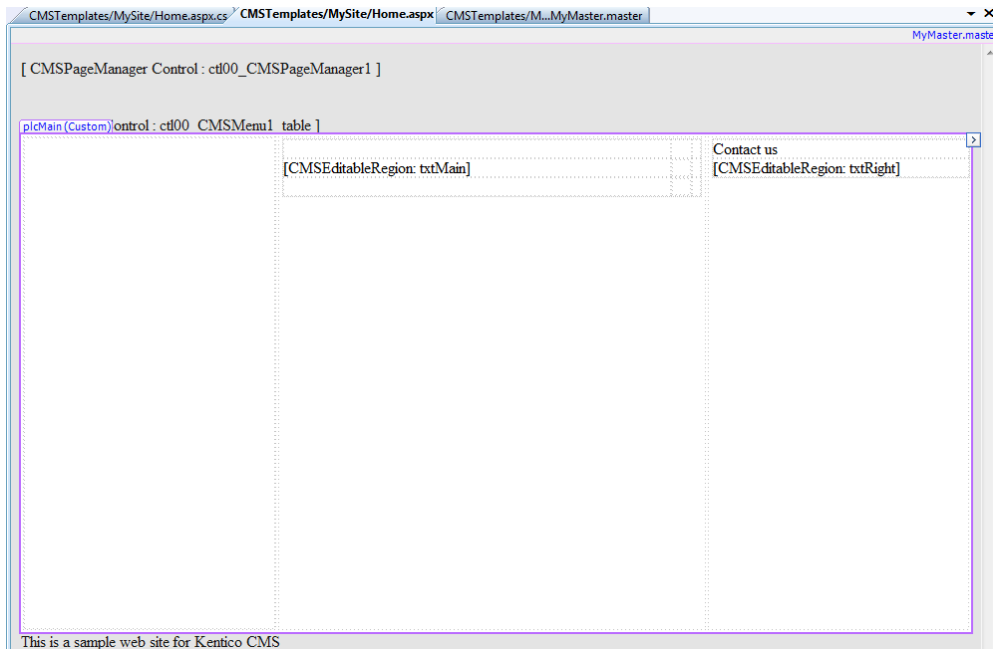

```
<%@ Page Language="C#" MasterPageFile="~/CMSTemplates/MySite/MyMaster.master" AutoEventWireup="true"
    CodeFile="Home.aspx.cs" Inherits="CMSTemplates_MySite_Home" Title="Untitled Page" %>
<asp:Content ID="Content1" ContentPlaceHolderID="plcMain" Runat="Server">
<!-- main content -->
<table style="width:100%;height:500px;border: 0px">
  <tr valign="top">
    <!-- left column -->
    <td style="width:280px" class="HomePageLeftColumn">
    </td>
    <!-- center column -->
    <td style="padding: 3px 5px 0px 5px;width:450px;">
      <!-- center box -->
      <table cellpadding="0" cellspacing="0" border="0" class="ContainerWithCorners" width="100%">
        <tr class="ContainerWithCornersRow ">
          <td class="ContainerWithCornersTopLeft">&nbsp;</td>
          <td class="ContainerWithCornersTop">&nbsp;</td>
          <td class="ContainerWithCornersTopRight">&nbsp;</td>
        </tr>
        <tr>
          <td class="ContainerWithCornersLeft">&nbsp;</td>
          <td class="ContainerWithCornersContent" valign="top">

          </td>
          <td class="ContainerWithCornersRight">&nbsp;</td>
        </tr>
        <tr class="ContainerWithCornersRow ">
          <td class="ContainerWithCornersBottomLeft">&nbsp;</td>
          <td class="ContainerWithCornersBottom"></td>
          <td class="ContainerWithCornersBottomRight">&nbsp;</td>
        </tr>
      </table>
    </td>
    <!-- right column -->
    <td style="padding: 3px 0px 0px 5px;width:270px">
      <!-- text box -->
      <table cellpadding="0" cellspacing="0" style="width: 100%;margin-bottom: 10px;" class="Blue">
        <tr>
          <td class="BoxTitle">Contact us
          </td>
        </tr>
        <tr>
          <td class="BoxArea" style="height: 19px">

          </td>
        </tr>
      </table>
    </td>
  </tr>
</table>
<!-- /main content -->
</asp:Content>
```

Switch to the **Design** tab and drag and drop two **CMSEditableRegion** controls on the page:

- one into the center cell of the center box
- one into the bottom cell of the right box

Set the following properties of the **CMSEditableRegion** controls:

- **ID:** txtMain
- **DialogHeight:** 300
- **RegionType:** HtmlEditor
- **RegionTitle:** Main content

- **ID:** txtRight
- **DialogHeight:** 280
- **RegionType:** HtmlEditor
- **RegionTitle:** Right content

Switch to the **code behind** and add reference to the **CMS.UIControls** namespace:

[C#]

```
using CMS.UIControls;
```

[VB.NET]

```
Imports CMS.UIControls
```

You also need to change the class definition so that it inherits from the **TemplatePage** class:

[C#]

```
public partial class CMSTemplates_MySite_Home : TemplatePage
```

[VB.NET]

```
Partial Class CMSTemplates_MySite_Home  
    Inherits TemplatePage
```

Save the changes.

Our master page and page template for the home page are ready. Now we need to register the home page template in Kentico CMS. Open Kentico CMS in a web browser and go to **Site Manager (http://localhost/KenticoCMS/CMSSiteManager)** -> **Development** -> **Page templates**.

Click the root and click **New category**. Create a new category with name **My web site**.

Click **New template** and enter the following values:

- **Template display name:** Home page
- **Template code name:** HomePage

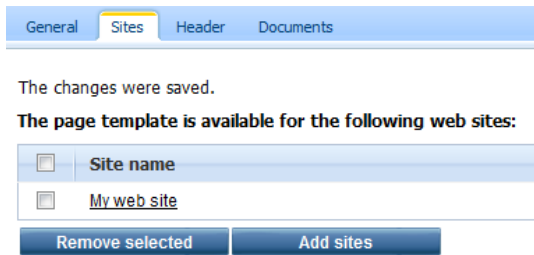

Click **OK** and set the following values on the **General** tab:

- **Template type:** ASPX page
- **File:** ~/CMSTemplates/MySite/home.aspx

The screenshot displays the Kentico CMS Site Manager interface. The top navigation bar includes 'Sites', 'Administration', 'Settings', 'Development' (selected), 'Licenses', and 'Support'. The left sidebar shows a tree view of 'Development' options, with 'Page templates' selected. The main content area is titled 'Page templates' and contains a list of template categories. A 'New template' button is visible. The 'Page template properties' panel on the right shows the configuration for the 'Home page' template. The 'General' tab is active, and the 'Save' button is highlighted. The configuration fields are as follows:

- Template display name: Home page
- Template code name: HomePage
- Category: My web site
- Template description: (empty text area)
- Thumbnail: Upload: (empty text input) Browse...
- Template type: Portal page ASPX page
- File name: ~/CMSTemplates/MySite/home.aspx

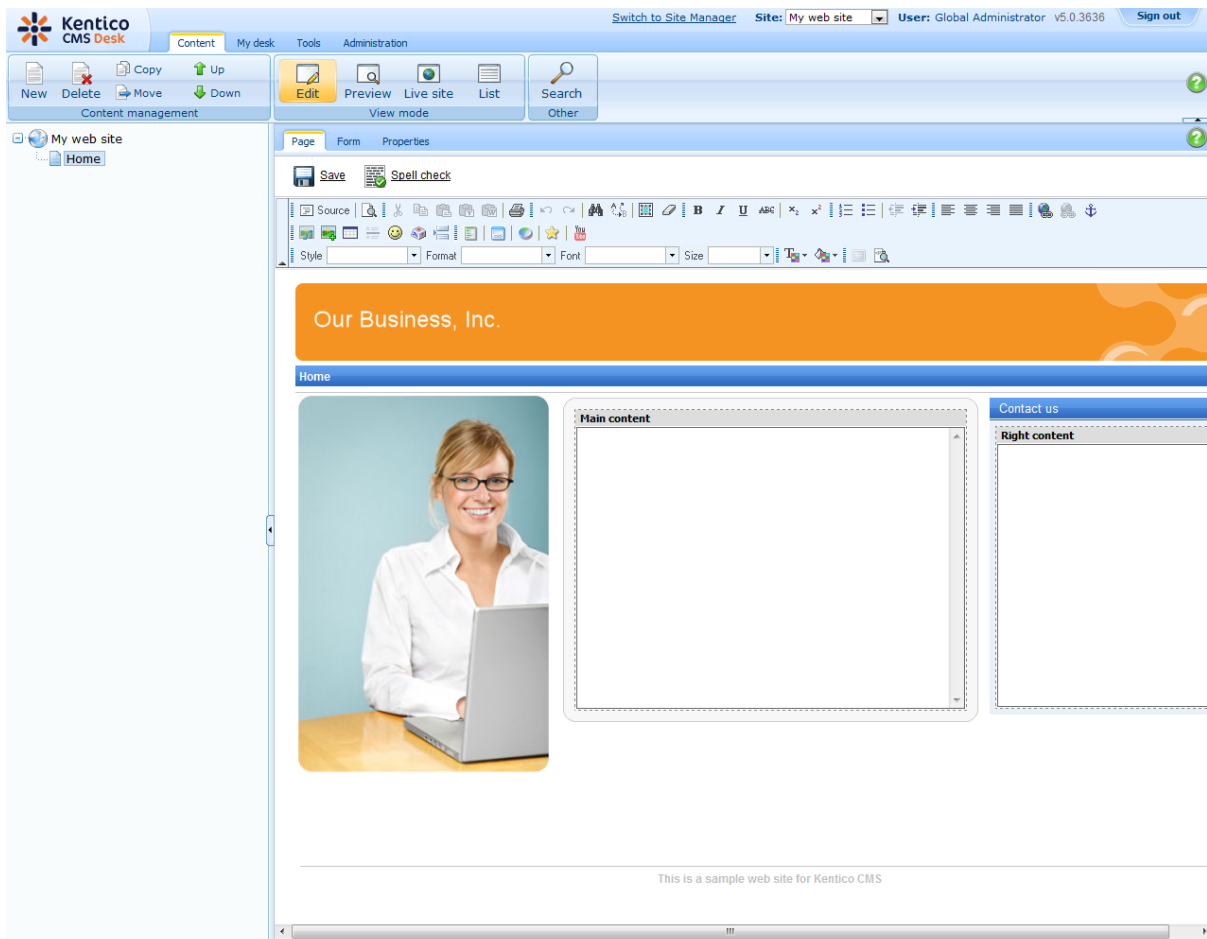

Click **OK** to save and click the **Sites** tab. Assign the new page template to your web site and click **OK**.

Go to **CMS Desk -> Content**. Click root and click **New**. Choose to create a new **Page (menu item)** and enter the following values:

- **Page name:** Home
- **Use page template:** My web site/Home page

Click **Save** and Click the **Page** tab. Now you can see that the page contains two editable regions.

Enter the following text:

- **Main text:** Here comes the welcome text.

- **Contact text:** Call 800 111 2222

Click **Save**. Click **Live site** and you will see the home page of your new web site.

Configuring the web site home page

When the site visitor comes to the root of your web site (e.g. to *http://www.example.com*), the system needs to know which page should be displayed as a home page. Go to **Site Manager -> Settings**, select **My web site**, click **Web site** and make sure the value **Default alias path** is set to **/Home**, which is the alias path of our new home page.

The screenshot shows the Kentico CMS Site Manager interface. The 'Settings' tab is active, and the 'Web site' settings are displayed. The 'Default alias path' is set to '/Home', which is highlighted with a red box. Other settings include cache times, culture, and page titles.

Setting	Value
Cache content (minutes)	10
Cache images (minutes)	10
Cache page info (minutes)	10
Combine with default culture	<input type="checkbox"/>
Combine files with default culture	<input checked="" type="checkbox"/>
Default alias path	/Home
Default culture of the content	English - United States
Page description prefix	
Page key words prefix	
Page title format	{%prefix%} - {%pagetitle_orselse_name%}
Page title prefix	My Site

7.8 News page

Now we will create the News section of our web site. Go to Visual Studio and create a new web form in the **CMSTemplates\MySite** folder, call it **NewsPage.aspx**, check the **Select master page** box and click **Add**. Choose the **MyMaster.master** master page and **click OK**.

Switch to the **Design** tab, drag and drop and configure the following controls:

CMSBreadCrumbs

(no properties to be set)

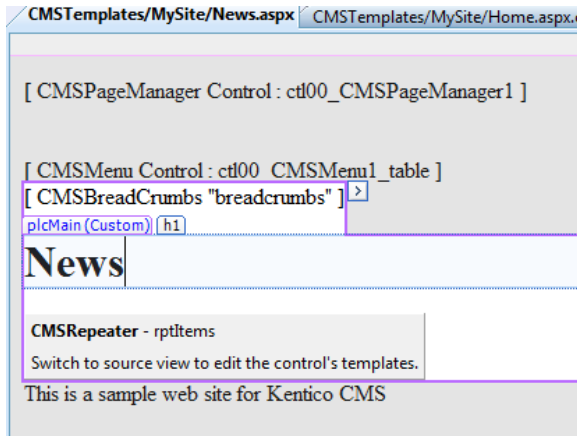

CMSRepeater

- ClassNames: cms.news
- TransformationName: cms.news.preview
- SelectedItemTransformationName: cms.news.default
- ItemSeparator: <hr />

Switch to the HTML mode and add the following HTML code between both controls:

```
<h1>News</h1>
```

When you switch back to the **Design** tab, you should see a page like this:

Switch to the **code behind** and add reference to the CMS.UIControls namespace:

[C#]

```
using CMS.UIControls;
```

[VB.NET]

```
Imports CMS.UIControls
```

You also need to change the class definition so that it inherits from the **TemplatePage** class:

[C#]

```
public partial class CMSTemplates_MySite_NewsPage : TemplatePage
```

[VB.NET]

```
Partial Class CMSTemplates_MySite_NewsPage  
    Inherits TemplatePage
```

Save all changes.

Page Template Registration

Go to **Site Manager -> Development -> Page templates**, click the **My web site category** and click **New template**. Create a new page template with following details:

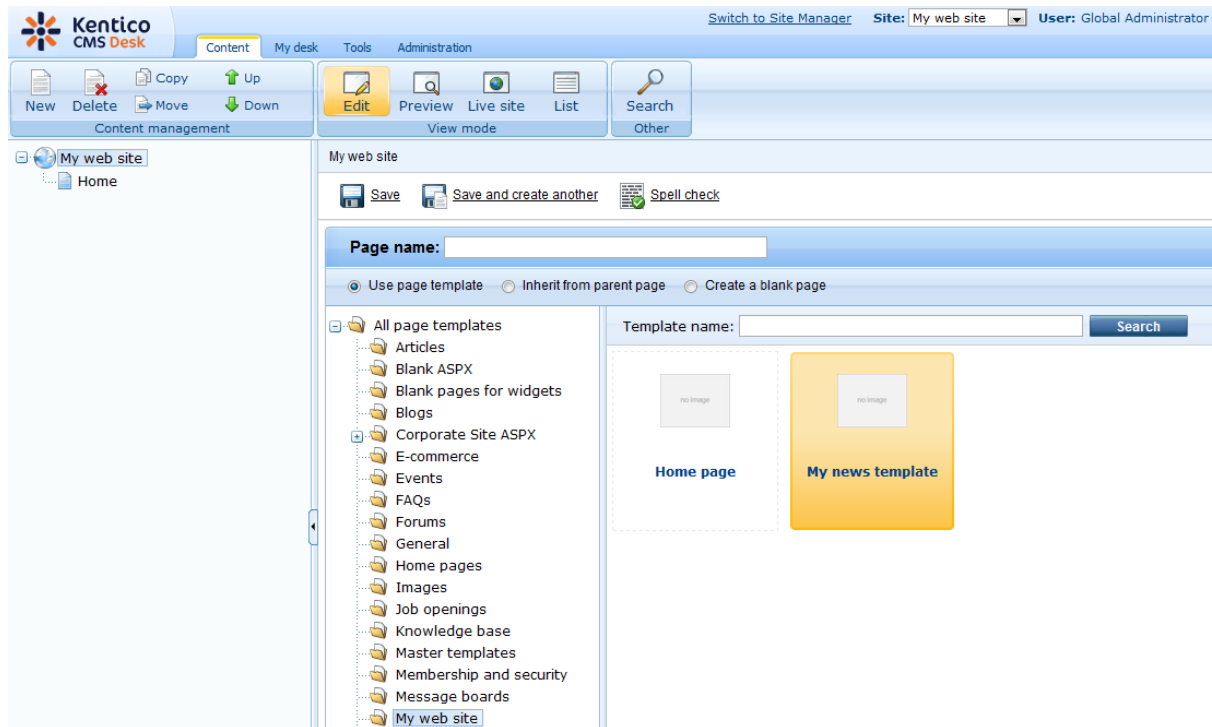

- Template display name: My news template
- Template code name: mynewstemplate

On the detail page, please choose:

- Template type: ASPX
- File name: ~/CMSTemplates/MySite/NewsPage.aspx

Switch to the **Sites** tab and assign the template to **My web site**.

Go to **CMS Desk -> Content**, click root and click **New**. Choose to create a new **Page (menu item)** using the **My web site/My news template page** template and call the page **News**.

Click **Save**. Click the **News** page and click **New**, choose to create a **news** document and enter the following text:

- News title: News 1
- Release date: click the date-time picker and click **Now** and click **OK**.
- News summary: News 1 summary.
- News text: News 1 text.
- Publish from, to: leave the fields blank.

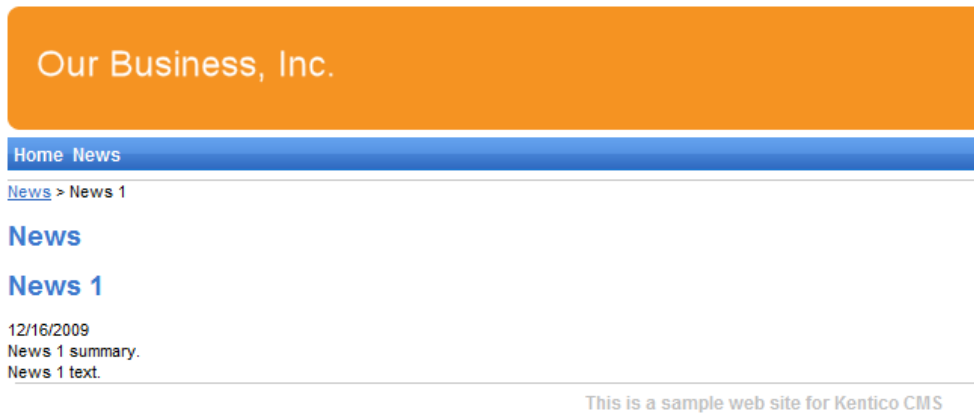

Click **Save and create another** and enter the following values:

- News title: News 2
- Release date: click the date-time picker and click **Now** and click **OK**.
- News summary: News 2 summary.
- News text: News 2 text.
- Publish from, to: leave the fields blank.

When you click **/News** and **Live site** now, you will see the list of news under the **News** section:

As you can see, the main page **/News** displays the list of the news items that are placed under it. This is an example of how the content is logically structured in Kentico CMS. When you click **/News/News 1** now, you will see the detail view:

The breadcrumbs now show you current path on the web site: **News > News 1**. The position is also reflected in the URLs:

- The URL of the News page is **/news.aspx**
- The URL of the News 1 page is **/news/news-1.aspx**

This makes the web site more accessible to both people and search engines, such as Google.

How it works

1. You go to the **/News page**.
2. The **CMSRepeater** control checks if you have selected some particular news item (based on its `ClassNames` property value).
3. It finds out that you have selected a page document, so it looks for all underlying news documents and displays them as a list using the **cms.news.preview** transformation.

When you click on some particular news item, such as **/News/News 1**, the **NewsRepeater** web part uses the **cms.news.default** transformation instead and displays the detail view.

Path expressions

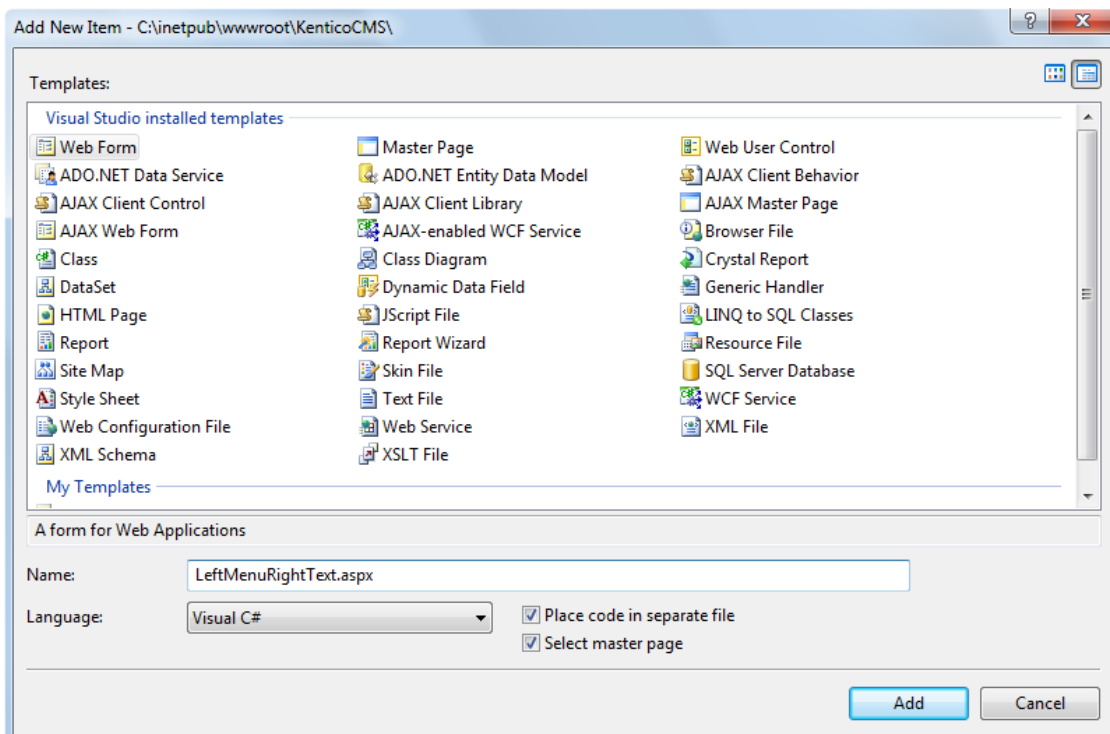

The Path property in web parts supports following special expressions that allow you select the content dynamically:

<code>/%</code>	All documents on the web site.
<code>/news/%</code>	All documents under <code>/News</code> .
<code>/news/news1</code>	News1 document.
<code>./%</code>	All items under the current document.
<code>./logo</code>	Logo document under the current document.
<code>./images/%</code>	All images under the <i>images</i> child document.
<code>../contacts/%</code>	All documents under the sibling document <i>contacts</i> .
<code>/{}%</code>	All documents under the current first level document. Example: if the currently selected document is <code>/news/news1</code> the expression is evaluated as <code>/news/%</code>

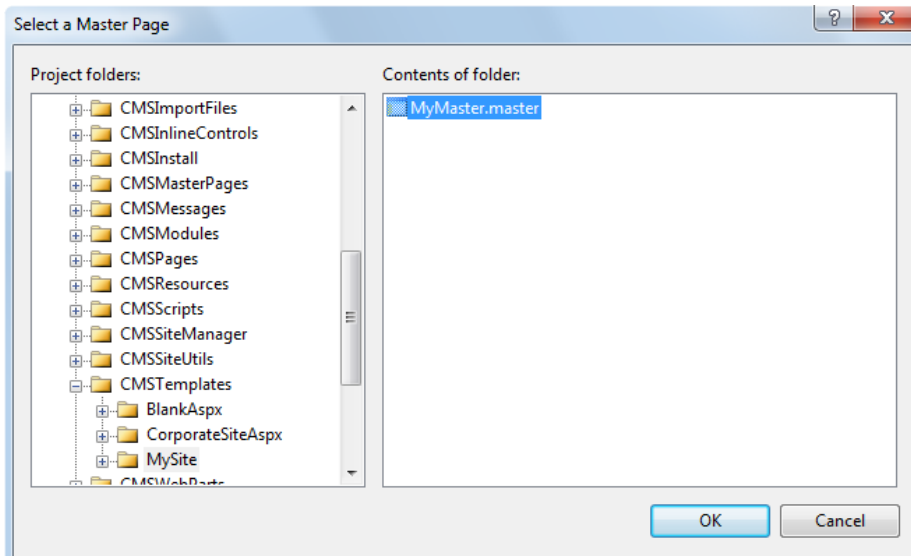

7.9 Services page

Now we will create a new site section for services. This site section will contain a left tree menu and a single editable region.

Go to Visual Studio and choose to create a new ASPX page in folder **CMSTemplates\MySite**. Call the page **LeftMenuRightText.aspx** and check the box **Select master page**:

Choose the **CMSTemplates\MySite\MyMaster.master** page on the next dialog:

Now enter the following HTML layout code inside the <asp:content> elements of the newly created page:

```
<table width="100%">
  <tr valign="top">
    <td width="20%">

    </td>
    <td width="80%">

    </td>
  </tr>
</table>
```

Switch to the **Design** tab and you will see a preview of the page, including the inherited master page.

Drag and drop the CMSTreeMenu control to the left column and the CMSEditableRegion control to the right column:

Set the following properties of the controls:

CMSTreeMenu1:

- **Path:** /{0}/% (this means that the menu starts from the second level)
- **MenuItemImageUrl:** ~/app_themes/mysite/images/bullet.gif
- **MenuItemOpenImageUrl:** ~/app_themes/mysite/images/bullet.gif
(the ~ character represents the root of the web site and it ensures that the image will be displayed correctly whether you run the web sites in the root or in a virtual directory)

CMSEditableRegion1:

- **RegionType:** HTML editor
- **Height:** 400
- **RegionTitle:** Main Text

Switch to the **code behind** and add reference to the CMS.UIControls namespace:

[C#]

```
using CMS.UIControls;
```

[VB.NET]

```
Imports CMS.UIControls
```

You also need to change the class definition so that it inherits from the **TemplatePage** class:

[C#]

```
public partial class CMSTemplates_MySite_LeftMenuRightText : TemplatePage
```

[VB.NET]

```
Partial Class CMSTemplates_MySite_LeftMenuRightText  
    Inherits TemplatePage
```

Save all changes.

Now we need to register our new page template. Go to **CMS Site Manager -> Development -> Page Templates** and click **My Web Site** and click **New template**. Enter the following values:

- **Template display name:** Left menu with right text
- **Template code name:** LeftMenuWithRightText

Click **OK**. Enter the following values on the **General** tab:

- **Template type:** ASPX page
- **File name:** ~/CMSTemplates/MySite/LeftMenuRightText.aspx

The screenshot shows the 'Page template properties' dialog box with the 'General' tab selected. The breadcrumb path is 'Templates > Left menu with right text'. The 'General' tab is active, with 'Sites', 'Header', and 'Documents' tabs visible. A 'Save' button is present. The form fields are: 'Template display name' (Left menu with right text), 'Template code name' (LeftMenuWithRightText), 'Category' (My web site), 'Template description' (empty text area), 'Thumbnail' (Upload: [text box] Browse...), 'Template type' (Portal page, ASPX page), and 'File name' (~/CMSTemplates/MySite/LeftMenuRightText.aspx).

Switch to the **Sites** tab and assign the template to your web site:

The screenshot shows the 'Page template properties' dialog box with the 'Sites' tab selected. The breadcrumb path is 'Templates > Left menu with right text'. The 'Sites' tab is active, with 'General', 'Header', and 'Documents' tabs visible. A message states 'The changes were saved.' and 'The page template is available for the following web sites:'. Below this is a list of sites with checkboxes: 'Site name' and 'My web site'. At the bottom are 'Remove selected' and 'Add sites' buttons.

Now that we created the page template, we can start adding new pages based on this template. Go to **CMS Desk -> Content**, click the **root** and click **New**. Choose to create a new **Page (menu item)** and enter the following values:

- **Page name:** Services
- **Use page template:** My web site/Left menu with right text

Click **Save**.

Now you are redirected to the **Page** tab and you can enter some content on the Services page:

The screenshot displays the Kentico CMS Desk interface. The top navigation bar includes 'Content', 'My desk', 'Tools', and 'Administration'. The 'Content' tab is active, showing a toolbar with 'New', 'Delete', 'Move', 'Up', and 'Down' buttons. The main workspace is divided into a left sidebar and a main editing area. The sidebar shows a tree view for 'My web site' with sub-items 'Home', 'News', and 'Services'. The main editing area has tabs for 'Page', 'Form', and 'Properties'. The 'Page' tab is selected, showing a 'Save' button and a 'Spell check' icon. Below this is a rich text editor toolbar with various formatting options. The page content features an orange header with the text 'Our Business, Inc.' and a blue navigation bar with links for 'Home', 'News', and 'Services'. A large text area labeled 'Main Text' is visible, and a footer note states 'This is a sample web site for Kentico CMS'.

Adding sub-pages

Click **New** in the main toolbar and choose to create a new page under the /Services page. Call the page **Service 1** and choose to use page template **My web site/Left menu with right text**. Click **Save**. Enter some text into the editable region and click **Save**.

7.10 Products page

7.10.1 Overview

Now we will add a new Products section displaying a list of computers and their technical specification. You will learn how to create a new document type *Computer* and how to display a list of computers on the site. You will also learn how write transformations.

7.10.2 New document type

Each document in the Kentico CMS repository is of some type, such as news, product, article, etc. Each document type has its own fields. Our document type will describe computer, so it will have a computer name, processor type, RAM size, disk size and a product image field.

Go to **Site Manager -> Development -> Document types** and click **New document type**. You are redirected to the New document type wizard. In the first step, enter the following values:

- **Document type display name:** *Computer (this name will be displayed to the users)*
- **Document type code name:** *custom.computer (custom is your namespace to distinguish your document types from system types that use the cms namespace, computer is the document type); you will use this value in web part properties later.*

The screenshot shows the Kentico CMS Site Manager interface. The top navigation bar includes 'Sites', 'Administration', 'Settings', 'Development', 'Licenses', and 'Support'. The 'Development' tab is selected. On the left, a tree view shows various development options, with 'Document types' highlighted. The main content area is titled 'New document type' and shows 'Step 1 | General'. Below this, there is a prompt: 'Please enter document type display name (for users) and code name (it will be used in your code when necessary)'. Two input fields are present: 'Document type display name' with the value 'Computer' and 'Document type code name' with the value 'custom.namespace.computer.document.type'. A green 'Next >' button is located at the bottom right of the form.

Click **Next**.

In step 2, you need to choose the name of the database table that will be used for storing computer details. You also need to enter the name of the primary key in this table. Leave the default values:

Step 2 | **Data type**
Please choose document data type. If you choose a document type with custom attributes you will also need to supply names of the new database table and its primary key.

The document type has custom fields
Table name:
Primary key name:

The document type is only a container without custom fields

[Next >](#)

Click **Next**. The wizard has created a new database table for computers. Now you need to define the fields (columns of the table). Click **New attribute** to create a new field. Enter the following values:

- **Attribute name:** ComputerName
- **Attribute type:** Text
- **Attribute size:** 200
- **Field caption:** Computer name
- **Field type:** Text box

Click **OK**. Click **New attribute**. Enter:

- **Attribute name:** ComputerProcessorType
- **Attribute type:** Text
- **Attribute size:** 200
- **Field caption:** Processor type
- **Field type:** Drop-down list, choose to use **Options**
- **Options:** enter the following options, one per line:
Athlon;Athlon
Pentium XEON;Pentium XEON
Pentium Core 2 Duo;Pentium Core 2 Duo

Click **OK**. Click **New attribute**. Enter:

- **Attribute name:** ComputerRamSize
- **Attribute type:** Integer Number
- **Field caption:** RAM (MB)
- **Field type:** Text box

Click **OK**. Click **New attribute**. Enter:

- **Attribute name:** ComputerHddSize
- **Attribute type:** Integer Number
- **Field caption:** HDD (GB)
- **Field type:** Text box

Click **OK**. Click **New attribute**. Enter:

- **Attribute name:** ComputerImage
- **Attribute type:** File
- **Allow empty value:** check the box
- **Field caption:** Image
- **Field type:** Upload file

Click **OK**.

Step 3 | **Fields**
Please define custom attributes of the document type and their appearance in the editing form. You can define attributes, such as product number, product weight, press release text, etc.

The changes were saved.

ComputerID	
ComputerName	
ComputerProcessorType	
ComputerRamSize	
ComputerHddSize	
ComputerImage	

Database

Attribute name:

Attribute type:

Attribute size:

Allow empty value:

Attribute default value:

Display attribute in the editing form

Field

Field caption:

Field type:

Automatic image resize on upload
(use site settings)

Width (px):

OK

Next >

Click **Next**.

Now you need to choose the field that will be used as document name. Choose the **ComputerName** field. It means that when you create a new computer document, its name will be automatically taken from the ComputerName value and this value will appear in site navigation and in CMS Desk content tree.

Step 4 | **Additional settings**
Please choose the source field that will be used as a document name. You can choose either one of the custom fields or you can choose to use document name as a separate field.

Document name source:

[Next >](#)

Click **Next**. In step 5, you need to select the document types under which the computers can be added in the content tree. Check only the **Page (menu item)** value, which means the editors will be able to create computer documents only under some page, not under article or news document in the content tree.

Step 5 | **Parent types**
Please select document types under which this document template can be placed.

<input type="checkbox"/>	Document type name
<input checked="" type="checkbox"/>	Page (menu item) (CMS.Menuitem)

[Remove selected](#) [Add document types](#)

[Next >](#)

Click **Next**. In step 6, you need to choose which web sites will use this document type. Check **My web site**.

Step 6

Sites

Please select sites where this document type can be used:

Site name

My web site

Remove selected

Add sites

Next >

Click **Next**. In Step 7, you are asked to specify how documents of this type should be indexed for searching and displayed in search results. Select the following values in the drop-downs:

- **Title field:** ComputerName
- **Content field:** DocumentContent
- **Image field:** ComputerImage
- **Date field:** DocumentCreatedWhen

Leave the default values for the rest of the options and click **Next**.

Step 7

Search options

Please set search fields for Smart search module.

Title field:

Content field:

Image field:

Date field:

Set automatically

Field name	Content	Searchable	Tokenized	Custom search name
ComputerID	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="text"/>
ComputerName	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="text"/>
ComputerProcessorType	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="text"/>
ComputerRamSize	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="text"/>
ComputerHddSize	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="text"/>

Next >

The wizard has finished the configuration of the new document type. It has automatically created not only the database table, but also the SQL queries for SELECT, INSERT, UPDATE, DELETE operations and a default transformation.

Step 8 | The wizard has finished

The setup has finished the following steps:

- The new document type was created.
- The new editing form was created.
- The document types were added among allowed child types of the new document type.
- The sites were selected where this document type can be used.
- The default queries were created.
- The default ASCX transformations were created.
- The default permission names were created.
- The default icon was created.
- Document smart search specification was created.

Finish

You have learned how to define a new document type.

How the content is stored

As you already know, the new document type Computer has its own database table. Each document is stored in three tables: **CMS_TREE** (tree structure), **CMS_Document** (document properties and metadata) and the custom table - in this case **CUSTOM_Computer**:

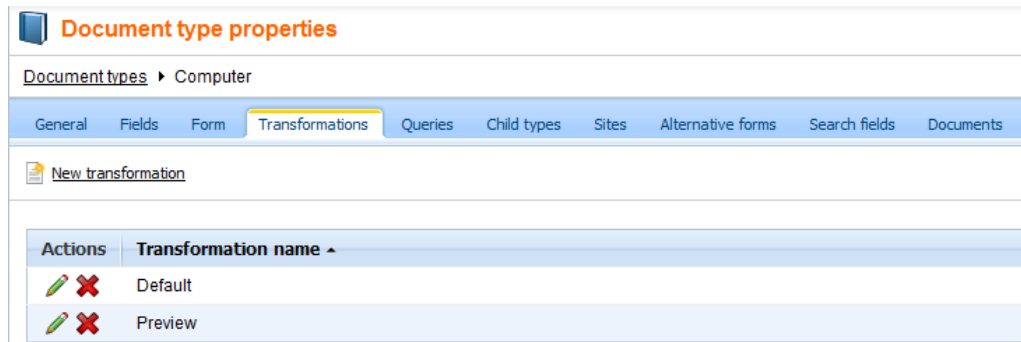

The system automatically ensures all operations on these tables. The advantage of this storage is that it's very fast and **you can easily write standard SQL SELECT queries to retrieve data** from the repository (i.e. from the Microsoft SQL Server database).

7.10.3 Transformations

Now that we have created a new document type, we need to prepare the transformations that will be used for displaying product details in a list and in a detail view.

In the **Computer** document type properties dialog, click the **Transformations** tab:

As you can see, the wizard has created some default transformations. We will use them for our detail view. Edit the **Default** transformation, clear the default code and enter the following code:

```
<h1>
  <%= Eval("ComputerName") %>
</h1>
<table>
  <tr>
    <td>
      Processor:
    </td>
    <td>
      <%= Eval("ComputerProcessorType") %>
    </td>
  </tr>
  <tr>
    <td>
      RAM (MB):
    </td>
    <td>
      <%= Eval("ComputerRamSize") %>
    </td>
  </tr>
  <tr>
    <td>
      HDD (GB):
    </td>
    <td>
      <%= Eval("ComputerHddSize") %>
    </td>
  </tr>
  <tr>
    <td>
      Image:
    </td>
    <td>
      <%= GetImage("ComputerImage") %>
    </td>
  </tr>
</table>
```

Click **Save**. As you can see the transformation code is the standard ItemTemplate code that you may already know from ASP.NET 2.0 Repeater and DataList controls. It combines HTML code with ASP.NET commands and data binding expressions. You can use several built-in functions, such as **GetImage** that simplify some tasks. You can find the list of the most important functions directly under the transformation code.

Now we will create transformation for the list of computers. Go back to the transformation list and edit the **Preview** transformation. Clear the default code and enter the following code:

```
<div style="text-align:center;border: 1px solid #CCCCCC">
<h2>
<a href="<%# GetDocumentUrl() %>"><%# Eval("ComputerName") %></a>
<h2>
?maxsidesize=120" />
</div>
```

Click **OK**.

Please note how the link to the document is created:

```
<a href="<%# GetDocumentUrl() %>"><%# Eval("ComputerName") %></a>
```

It consists of standard HTML tags for links and it inserts the URL and link text dynamically.

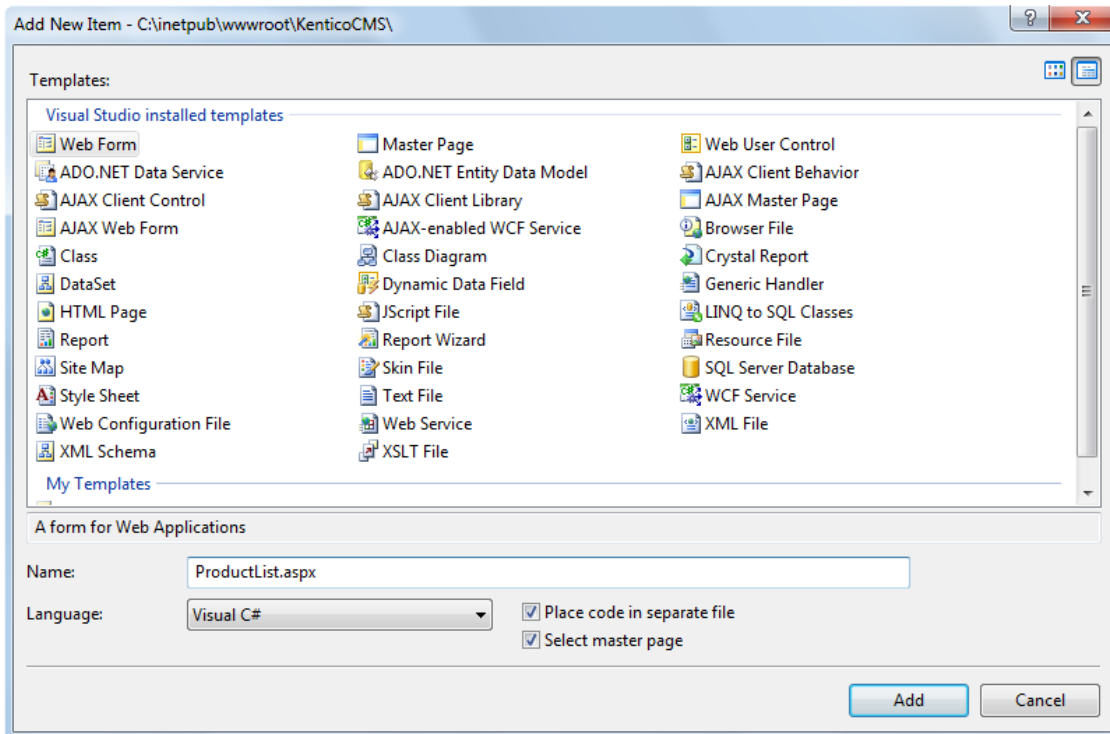

Similarly, you can create an image tag with parameter that ensures automatic resize of the longest side to 120 pixels on the server side:

```
?maxsidesize=120" />
```

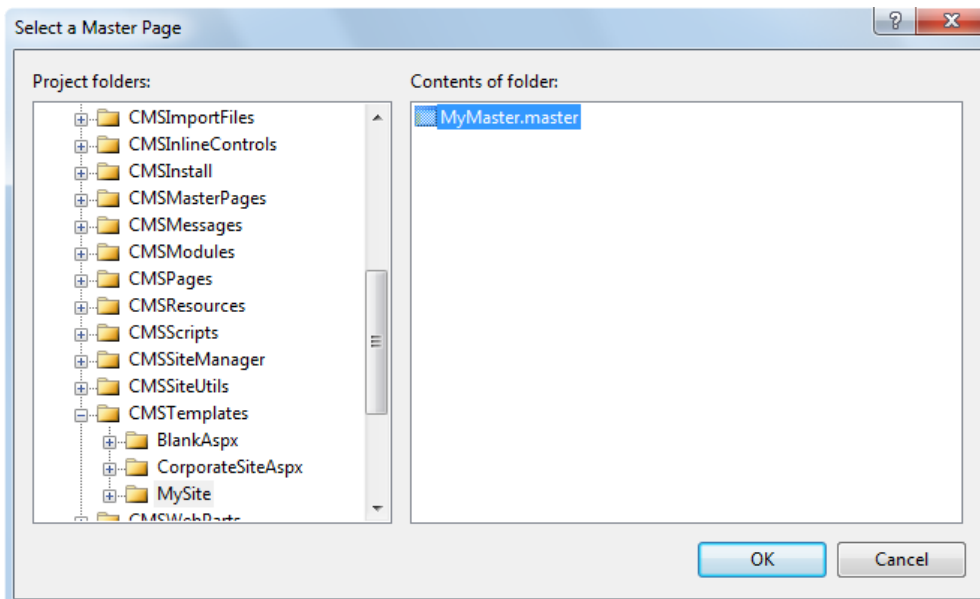

You have learned how to write transformations for displaying the content of structured documents.

7.10.4 Page template

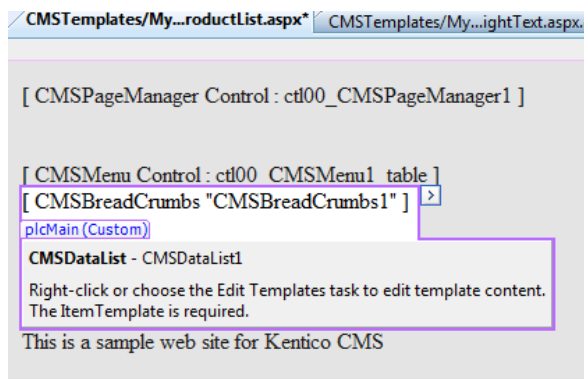

Now we get to the final step of this chapter: publishing computer specifications on your web site. Go to Visual Studio and choose to create a new ASPX page in folder **CMSTemplatesMySite**. Call the page **ProductList.aspx** and check the box **Select master page**:

Choose the **CMSTemplates\MySite\MyMaster.master** page on the next dialog:

Switch to the **Design** tab and you will see a preview of the page, including the inherited master page. Drag and drop the CMSBreadCrums and CMSDataList controls on the page:

Set the following properties of the controls:

CMSDataList

- **ClassNames:** custom.computer (the document types to be displayed)
- **OrderBy:** ComputerName ASC
- **TransformationName:** custom.computer.preview
- **SelectedItemTransformationName:** custom.computer.default
- **RepeatColumns:** 2

Switch to the **code behind** and add reference to the CMS.UIControls namespace:

[C#]

```
using CMS.UIControls;
```

[VB.NET]

```
Imports CMS.UIControls
```

You also need to change the class definition so that it inherits from the **TemplatePage** class:

[C#]

```
public partial class CMSTemplates_MySite_ProductList : TemplatePage
```

[VB.NET]

```
Partial Class CMSTemplates_MySite_ProductList
    Inherits TemplatePage
```

Save all changes.

Now we need to register our new page template. Go to CMS Site Manager -> Development -> Page Templates and click **My Web Site** and click **New template**. Enter the following values:

- **Template display name:** Product list
- **Template code name:** ProductList

Click **OK**. Enter the following values on the General tab:

- **Template type:** ASPX page
- **File name:** ~/CMSTemplates/MySite/ProductList.aspx

Switch to the **Sites** tab and assign the template to your web site:

Page template properties

Templates ▾ Product list

General Sites Header Documents

The changes were saved.

The page template is available for the following web sites:

<input type="checkbox"/>	Site name
<input type="checkbox"/>	My web site

Now that we created the page template, we can start adding new pages based on this template. Go to **CMS Desk -> Content**, click the **root** and click **New**. Choose to create a new **Page (menu item)** and enter the following values:

- **Page name:** Products
- **Use page template:** My web site/Product list

Click **Save**.

Now we need to enter some computer details. Click **/Products** in the content tree and click **New**. Choose to create a new computer. Enter the following value:

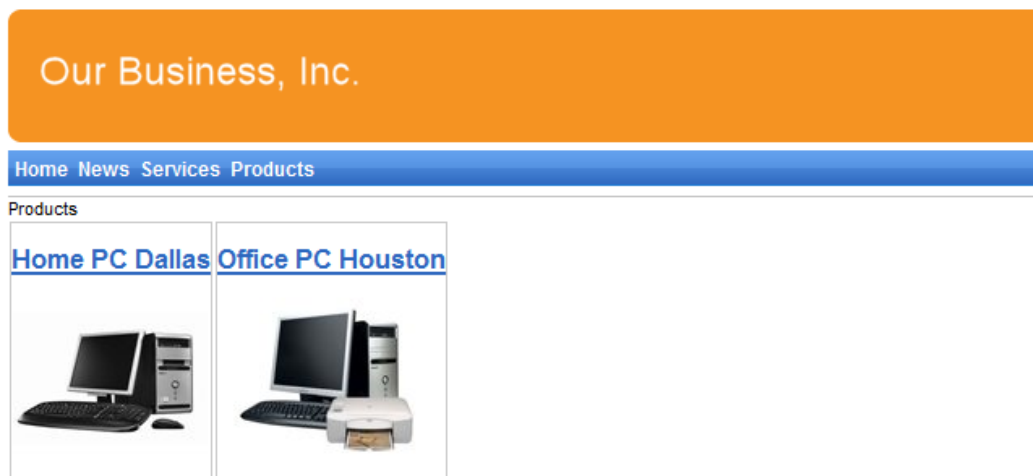

- **Computer name:** Home PC Dallas
- **Processor type:** Athlon
- **RAM (MB):** 512
- **HDD (GB):** 80
- **Image:** upload some image (you can find sample images in folder <Kentico CMS installation>\CodeSamples\SampleWebTemplate\Computer_Images)
- **Publish from/to** - leave the values blank

Click **Save and create another** and enter:

- **Computer name:** Office PC Houston
- **Processor type:** Pentium Core 2 Duo
- **RAM (MB):** 1024
- **HDD (GB):** 120
- **Image:** upload some image (you can find sample images in folder <Kentico CMS installation>\CodeSamples\SampleWebTemplate\Computer_Images)
- **Publish from/to** - leave the values blank

Click **Save**.

Now, when you click **/Products** you will see a page like this:

This is a sample web site for Kentico CMS

When you click on some link, you will see computer details:

The screenshot shows a web page layout. At the top is an orange header with the text "Our Business, Inc.". Below it is a blue navigation bar with links for "Home", "News", "Services", and "Products". Underneath the navigation bar, there is a breadcrumb trail: "Products > Home PC Dallas". The main heading is "Home PC Dallas". Below the heading, the specifications are listed: "Processor: Athlon", "RAM (MB): 512", and "HDD (GB): 80". To the left of the specifications, the word "Image:" is followed by a placeholder for an image. The image shows a desktop computer system including a monitor, keyboard, mouse, and a tower PC case. At the bottom right of the page, there is a small text note: "This is a sample web site for Kentico CMS".

You have learned how to define a new document type and how to publish its documents on the web site.

7.11 Search page

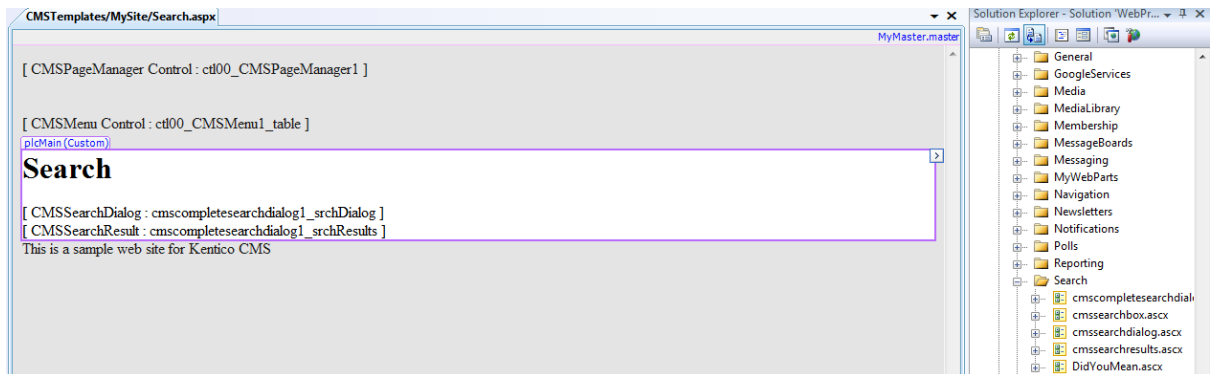

Kentico CMS allows you to full-text search all documents in Kentico CMS repository. You can also configure it so that it searches the text inside uploaded documents, such as PDF, DOC or XLS documents. The configuration is described in **Developer's Guide -> Installation and deployment -> Configuration of full-text search in files**. It's not necessary to configure it at this moment since we will use the database search only.

Go to Visual Studio and choose to create a new ASPX page in folder **CMSTemplates\MySite**. Call the page **SearchPage.aspx** and check the box **Select master page**. Choose the **CMSTemplates\MySite\MyMaster.master** page on the next dialog.

Add the following HTML code inside the <asp:content> element:

```
<h1>Search</h1>
```

Switch to the **Design** tab and drag and drop the user control **CMSWebParts/search/cmscompletesearchdialog.ascx** under the Search header:

Set its properties:

- **TransformationName:** cms.root.searchresults
- **ShowSearchScope:** false

Switch to the **code behind** and add reference to the CMS.UIControls namespace:

[C#]

```
using CMS.UIControls;
```

[VB.NET]

```
Imports CMS.UIControls
```

You also need to change the class definition so that it inherits from the **TemplatePage** class:

[C#]

```
public partial class CMSTemplates_MySite_SearchPage : TemplatePage
```

[VB.NET]

```
Partial Class CMSTemplates_MySite_SearchPage  
    Inherits TemplatePage
```

Save the changes. Now we need to register our new page template. Go to **CMS Site Manager -> Development -> Page Templates** and click **My Web Site** and click **New template**. Enter the following values:

- **Template display name:** Search page
- **Template code name:** searchpage

Click **OK**. Enter the following values on the General tab:

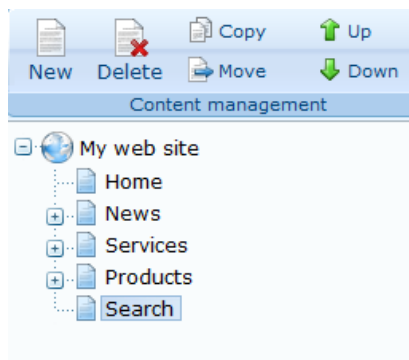

- **Template type:** ASPX page
- **File name:** ~/CMSTemplates/MySite/SearchPage.aspx

Switch to the **Sites** tab and assign the template to **My web site** site.

Go to **CMS Desk -> Content**, click the **root** and click **New**. Choose to create a new **Page (menu item)** and enter the following values:

- **Page name:** Search
- **Use page template:** My web site/Search page

Click **Save**. Click the **Down** arrow in the main toolbar until you move the **Search** page at the end of the list.

Click the new **/Search** page. You will see the search page. Enter **PC** in the **Search for** box and click **Go**.

This is a sample web site for Kentico CMS

When you click some search result, you are redirected to the appropriate document.

Modifying the search results format

If you prefer a different design of the search results, you can modify the format in **Site Manager -> Development -> Document types -> Root -> Transformations -> searchresults** transformation.

7.12 Secured section for partners

Kentico CMS allows you to create secured site sections that can be accessed only by users who have a valid user name and password. We will create a simple page for partners that can be accessed only by registered users.

Go to **CMS Desk -> Content**, click root and click **New**. Choose to create a new **Page**. Enter page name **Partners** and choose to use the page template **My web site/Left menu with right text**. Click **Save**. Click the **Down** arrow in the main toolbar until you move the **Partners** page at the end of the list.

Click **Page** and enter the following text: This is a secured page for partners. Click **Save**.

Click **Properties -> Security**. In the **Access** section of the dialog, click **Yes** and click **OK**. This will ensure that the page can be accessed only by authenticated users.

Now we need to create the logon page. Go to Visual Studio and choose to create a new ASPX page in folder **CMSTemplates\MySite**. Call the page **LogonPage.aspx** and check the box **Select master page**. Choose the **CMSTemplates\MySite\MyMaster.master** page on the next dialog.

Add the following HTML code inside the `<asp:content>` element:

```
<table border="0" width="100%">
  <tr valign="top">
    <td style="width:50%">
      </td>
    <td style="width:50%">
      </td>
  </tr>
</table>
```

Switch to the **Design** tab and drag and drop the user control **CMSWebParts/Membership/LogonForm.ascx** inside the left column and the **CMSWebParts/Membership/RegistrationForm.ascx** user control into the right column. Set their properties:

LogonForm1

- **AllowPasswordRetrieval:** true
- **SendEmailFrom:** <your e-mail address>

RegistrationForm1

- **AssignRoles:** _notauthenticated_
- **EnableUserAfterRegistration:** true

Switch to the **code behind** and add reference to the CMS.UIControls namespace:

[C#]

```
using CMS.UIControls;
```

[VB.NET]

```
Imports CMS.UIControls
```

You also need to change the class definition so that it inherits from the **TemplatePage** class:

[C#]

```
public partial class CMSTemplates_MySite_LogonPage : TemplatePage
```

[VB.NET]

```
Partial Class CMSTemplates_MySite_LogonPage  
    Inherits TemplatePage
```

Save the changes. Now we need to register the logon page. Go to **Site Manager -> Development -> Page templates**, choose category **My web site** and register a new page template with following values:

- **Template display name:** Logon page
- **Template code name:** LogonPage
- **Template type:** ASPX page
- **File name:** ~/CMSTemplates/MySite/logonpage.aspx

Save the changes, switch to the **Sites** tab and assign the template to **My web site**. Now go to **CMS Desk -> Content**, click **Root**, click **New** and choose to create a new folder. Call the folder **Special pages**. Create a new page under the **Special pages** folder, call it **Logon** and choose the page template **My web site -> Logon page**. Click **Save**.

Configuring the logon page

We will need to configure the system so that it uses our new logon page. Go to **Site Manager -> Settings**, choose **My web site** in the drop-down list, click **Security** and set the value **Secured areas logon page** to **~/Special-pages/Logon.aspx**, which is the relative URL of our logon page (from the web application root). Click **Save**.

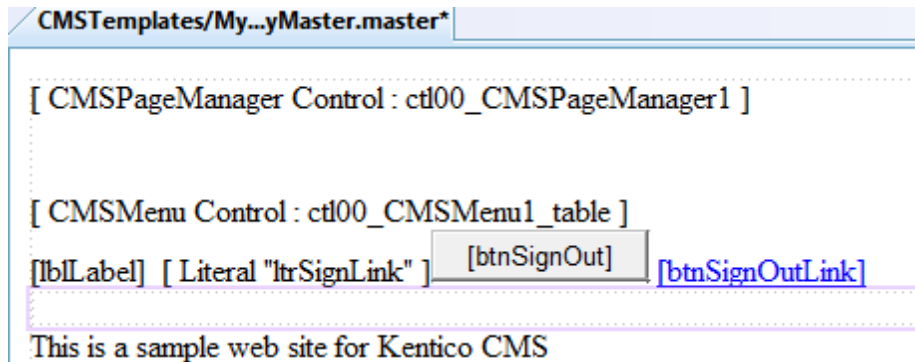

The screenshot shows the Kentico CMS Site Manager interface. The top navigation bar includes 'Sites', 'Administration', 'Settings' (selected), 'Development', 'Licenses', and 'Support'. The user is logged in as 'Global'. The left sidebar shows a tree view of settings categories, with 'Security' selected. The main content area is titled 'Security' and contains a 'Save' button and a 'Reset these settings to default' link. Below this, a message states 'The changes were saved.' The settings are as follows:

Setting	Value	Inherit from global settings
Send password e-mails from	admin@localhost.local	<input checked="" type="checkbox"/>
Check page permissions	Secured areas	<input checked="" type="checkbox"/>
Website logon page URL	~/logon.aspx	<input type="checkbox"/>
Access denied page URL		<input checked="" type="checkbox"/>
Enable banned IPs	<input type="checkbox"/>	<input checked="" type="checkbox"/>
Redirect banned IPs to URL	~/CMSMessages/BannedIP.aspx	<input checked="" type="checkbox"/>
Enable flood protection	<input type="checkbox"/>	<input checked="" type="checkbox"/>
Flood interval	20	<input checked="" type="checkbox"/>
Enable UI personalization	<input type="checkbox"/>	<input checked="" type="checkbox"/>

At the bottom of the settings list, there is a link for 'Export these settings'.

Adding the Sign out button

Now we will add the "current user name" and "sign out" controls to our master page. Open the master page **MyMaster.master** in Design mode in Visual Studio and drag and drop the **CMSWebParts\Membership\CurrentUser.ascx** and **SignOutButton.ascx** controls just under the **CMSMenu** control:

Set the following property values of these controls:

CurrentUser1

- **ShowOnlyWhenAuthenticated:** true
- **CssClass:** CurrentUser

SignOutButton1

- **ShowOnlyWhenAuthenticated:** true

Now go to **Site Manager -> Development -> CSS Stylesheets** and add the following code to the end of the stylesheet used by your site:

```
.CurrentUser
{
  color: black;
}
```

Save the changes.

Sign out. Click Partners in the main menu. You are redirected to the logon page:

The screenshot shows the logon page for 'Our Business, Inc.'. At the top is an orange header with the company name. Below it is a blue navigation bar with links: Home, News, Services, Products, Search, Partners. The main content area is divided into two sections. On the left, under 'Log on', there are input fields for 'User name:' and 'Password:', a 'Remember me' checkbox, and a 'Log on' button. A link for 'Forgotten password' is below. On the right, under 'Not a member yet? Sign up now!', there are input fields for 'First name:', 'Last name:', 'E-mail:', 'Password:', and 'Confirm password:', along with a 'Register' button. At the bottom, it says 'This is a sample web site for Kentico CMS'.

Now you need either to sign in as administrator or sign up and create a new account. After you sign in successfully, you will see the Partners page content together with **Sign out** button:

The screenshot shows the secured Partners page for 'Our Business, Inc.'. It has the same orange header and blue navigation bar as the logon page. In the top right corner, it displays 'Current user: Global Administrator (administrator)' and a 'Sign out' button. Below the navigation bar, it says 'This is a secured page for partners.' and 'This is a sample web site for Kentico CMS'.

You have learned how to secure part of the web site so that it's only accessible for registered users.

Displaying personalized content based on user's permissions

Kentico CMS also allows you to display a personalized content based on user's read permissions. You can e.g. grant gold partners with Read permission for the Gold partners section and then only the gold partners will see the menu item and page content.

You can find more details on personalized content in **Developer's Guide -> Security, permissions and personalization -> Displaying personalized content.**

You have just finished the sample web site.

Part

Further steps

8 Further steps

8.1 Further steps

This is the end of the Kentico CMS Tutorial. If you need any further details, you will find them in **Kentico CMS Developer's Guide**. It covers also other advanced topics, such as:

- Multi-lingual content
- Multi-site configuration
- Workflow and versioning
- Security administration
- Deployment to the live web site
- Newsletters, BizForms and other modules
- Kentico CMS API and extensibility
- and many other features.

If you cannot find some information, please feel free to contact us at <http://www.kentico.com/Support.aspx>
