Fixed bugs

The hotfix applies to the following bugs:

Bugs fixed in hotfix 5.0.14

- Page title displayed cached macro values instead of current values.
- Site deletion threw an exception if the application was running in a web farm.
- Flash object didn't support secured HTTP connection.
- Media library security management didn't work correctly for group administrators in live site group management.
- An exception was thrown when an image that had not yet been published was selected in the Editable image web part.
- Navigation web parts threw an exception when they were used with the Check permissions option set to true.

Bugs fixed in hotfix 5.0.13

- Message boards - Group administrators could not manage group message boards' authorized roles.
- "Prompt to save changes on exit" setting did not work properly.
- Forums - thread sorting didn't work properly in special cases.
- Minor design issues.

Bugs fixed in hotfix 5.0.12

- Drag&Drop of web parts and widgets didn't work properly in horizontal direction.
- Macros defined in web part properties were not copied when duplicating a web part.
- Cache minutes value defined for full page caching was ignored and 10 minutes was used instead of the document's setting.
- Some document properties were inherited from the parent document even if the document had its own properties set.
- The document custom data weren't saved correctly for versioned documents.
- User account was not assigned to a customer when "Create a login for the website" option was chosen in CMSDesk E-commerce administration.
- Paging in CustomTableDataGrid and QueryDataGrid web parts didn't work properly.
- Minor design issues.

Bugs fixed in hotfix 5.0.11

- Groups - Forum search result links were not correct due to invalid default forum group settings.

- Web parts - Flash web part was not working when the "Automatically activate the object" option was enabled and the "Additional parameters" property was empty at the same time.
- WYSIWYG Dialogs - The "Insert image or media" and "Insert link" dialogs didn't open properly if the application ran on a different port than the one which the visitor used to access the site.
- Staging - View of a document type was not deleted on the target server when the document type was deleted.
- WebFarm - Avatar images and On-line users generated unneeded web farm tasks in special cases.

Bugs fixed in hotfix 5.0.10

- UniPager didn't work properly if a bound control was placed under it.
- Widgets - User and group widgets were not correctly displayed on live site in special cases.
- Site selector in CMS Desk didn't work properly for site domains with application path.
- Improved retrieving of ImageAlign in UniMenuButtons.ascx control.
- Long input values could cause an exception to be thrown when sending a message.
- WYSIWYG Editor dialogs - Editing links could cause exceptions if Content or Attachments tab was selected.
- Image editing wasn't possible on the live site in some special cases.

Bugs fixed in hotfix 5.0.9

- Messaging - There was a problem with replying and forwarding messages when the subject was too long.
- Widgets - An exception was thrown in some special cases when adding a Message board widget.
- Custom tables - The cache dependencies for custom table data weren't handled correctly.
- Media library - When a folder name contained an apostrophe, some actions didn't work properly.
- Import/Export - When user checked the option to export ASPX templates folder, not all files within this folder were exported.
- Media library - A wrong error message was thrown when uploading a thumbnail with an extension that was not allowed.
- FCK Editor - Base path property was not applied.
- UrlRewriter - Extension-less URLs could throw an exception "Length cannot be less than zero." in special cases.
- WYSIWYG Editor - Inserting flash object in the source code mode wasn't handled correctly if an object tag was present.
- Groups - Group code names weren't handled correctly in the administration interface.
- Minor design issues

Bugs fixed in hotfix 5.0.8

- Custom tables - Custom table datagrid was not reflecting columns settings.
- Enabled webpart Bindings and Code tabs could cause an exception when adding webparts on a page.

- Webparts - Flash webpart was causing JavaScript errors if the Flash.NotSupported resource string contained apostrophes.
- Categories - Multiple category selector was not working properly in User contributions.
- SmartSearch - Smart search filter web part displayed an extra label.
- Unicode characters in metadata attributes were incorrectly encoded.
- Output filter - Excluded paths were ignored for extension-less and custom-extension URLs.
- Webpart properties - Using the left anchor menu caused design to break.
- Messaging - There was a problem with sending messages when user had too long nickname.
- Viewing attachments was impossible in IE in the document version comparison dialog.
- Minor design issues.

Bugs fixed in hotfix 5.0.7

- CMSPersonalizeUserInterface site settings key was not in proper settings category after import of a site package from previous versions.
- Media library – If folder name contained an apostrophe, some actions in media library UI and WYSIWYG editor dialogs didn't work properly.
- Minor design issues.
- Document tags – Update of child documents' tags was executed even when it wasn't necessary.
- Friends – When a user requested a new friendship and a confirmation message was sent, recipient nickname was not displayed in Outbox.
- URL Path of multilingual documents wasn't correctly processed in special cases.
- Automatic image resize on upload didn't work for custom fields of E-commerce system tables.
- Unsorted attachments were not displayed for multilingual documents if the "Combine with default culture" setting wasn't set.
- UTF8 special characters were not handled properly in Insert image or media and Insert link dialogs.

Bugs fixed in hotfix 5.0.6

- Blogs - Default template of the "Blog month" document type was not applied when "Blog month" was created automatically.
- Custom tables – CustomTableItem didn't implement the IDataContainer interface.
- PageNotFoundUrl page not always responded with 404 HTTP status code.
- Ecommerce - Product image path was lost after product properties were submitted while having UseMetaFileForProductImage set to true and Product image path set to a non-metafile path.
- On-line users module could throw the "Non-negative number required" exception in special cases.
- Web part properties didn't display the scrollbar properly in case that the WYSIWYG editor was used.
- Media library – An error occurred when renaming media file name to a name which was already used by another media file in the same folder.
- Media library – Deletion of a media library caused exception when you copied its root folder to itself before the deletion.
- Multiple operations – Linking documents between sites wasn't working correctly in specific cases.
- Minor design issues.

Bugs fixed in hotfix 5.0.5

- Ecommerce – Customization of the CalculateShipping method in CMSShippingInfoProvider did not work properly.
- Export – Web parts weren't preselected correctly when a user chose to export a site.
- Widgets - Rich text widget - the editor toolbar wasn't displayed properly for different toolbar sets.
- Documents – Exception was thrown in the special case when user deleted document with set up document permissions.
- Minor design issues.
- Messaging – Friend user selector was using the livesite stylesheet in CMSDesk.
- Media library – Folders with special characters weren't handled correctly when a user renamed or deleted these folders.
- Custom tables – Redundant message was displayed when a user had insufficient permissions in the Tools section.
- Macros defined in the "URL redirection" property weren't resolved in navigation controls.
- Page title wasn't encoded correctly after partial postback.
- Tag selector – Selecting a tag by clicking on tag name was not possible.
- Media library – Image editor did not open in the Insert image or media dialog.
- Attachments – Field selection form control could throw a javascript error in IE8.
- Staging – UI elements weren't deleted on target server during the synchronization.
- Export objects – Objects weren't preselected correctly in Step 2 when you returned from there to Step 1 and then moved back to Step 2 again.
- Groups – Group page didn't have friendly menu caption after group registration.
- Multiple operations – There were problems with listing and tree refreshing when canceling a delete operation.
- Top N property was ignored in web parts with custom queries.
- Groups - Group names with unicode characters weren't processed correctly.

Bugs fixed in hotfix 5.0.4

- TreeProvider – Alias path with special characters wasn't processed correctly.
- CSSListMenu – Menu item with javascript action contained wrong URL.
- Ecommerce – Volume discount dialog didn't work properly in Internet Explorer.
- Media library – Folder edit control didn't display properly after unsuccessful validation.
- Media library – "File created by" information changed to N/A for public users.
- Media library – New folder dialog was not working properly when Windows authentication was enabled.
- Media library – Creating new media library could throw an exception in case of wrong permissions.
- Newsletters – CSS stylesheets of newsletter templates were not cached properly.
- Staging/Import/Export – Child objects count wasn't updated correctly for page template, web part and widget categories.
- Media library – Group media library viewer web part didn't process site name correctly.
- Recycle bin – Document name path filter wasn't working properly in specific situations.
- Media library – If an error occurred when uploading a file, an error message appeared several times.
- Multiple operations – Tree was not refreshed correctly after canceling the delete operation.
- Web part or page template disappeared from the administration interface if its category was changed.
- Web parts – User context menu from Members transformation might cause the ViewState of other controls to be lost.

Bugs fixed in hotfix 5.0.3

- Staging – UI elements weren't synchronized correctly in special cases.
- Staging – Renaming of media file wasn't synchronized correctly.
- Export to Excel2007 – An error occurred when opening a file with exported GUID data.
- Site with site domain name which was already used could be started.
- Media library – If the title for a file contained special characters, it caused JavaScript error when trying to select such file and then it was not possible to select any file.
- Media library – Group media library security checkbox had wrong image path on live site.
- WYSIWYG editor – Tooltip over the "Quickly insert image" button didn't work in Firefox.
- WYSIWYG editor dialogs – Inserting path didn't reflect the "Include sub-items" checkbox.
- Media library – Some icons weren't set properly in live site management.
- Google sitemap – Page was not rendered correctly for the lastmod element.
- Forums – Notification e-mails with plain text didn't resolve BB macros correctly.
- WebFarms – In special cases, synchronization tasks weren't deleted from the task queue.
- Import of page templates could throw an exception in special cases.
- Minor design issues.
- List page and Preview page properties of document types were not reflected.
- Media library – Several design changes for live site.
- Form engine – SQL query that filled a field with values caused an error if it contained characters like '<', '>'.
- Field selection form control was not using UniSelector.
- Workflow documents – Selection in grid was not working properly.
- UI personalization – CMS Desk -> Tools -> Blogs section was accessible only to global administrators when UI personalization was enabled.

Bugs fixed in hotfix 5.0.2

- The Administration section in Site Manager wasn't displayed correctly in RTL UI cultures.
- Ecommerce – Image selector did not open in the correct configuration.
- Uploader control – URLs of images of the control weren't resolved correctly in special cases.
- Media library – New folder dialog used wrong format for new directory in some cases.
- Workflow scopes – Document type selector was opening a live site dialog.
- UniGrid – Filters did not work properly with diacritic characters.
- Web parts – WMP web part does not work properly in specific cases.
- Web parts – Real media web part was displaying alternative text even when Real player was installed (Firefox, Opera).
- Messaging – User selection dialog was not working properly when Windows authentication was enabled.
- Import/Export – Import of a package from an older version to an empty project could cause some system queries to be missing.
- Minor design issues.
- Staging – An error was shown when complete synchronization was performed on the Data tab.
- Content – Document filter in the listing mode didn't work correctly in specific cases.
- Webparts - HeaderTemplate and SeparatorTemplate properties were not working properly in Attachment lightbox gallery.
- Staging - Synchronization of Media library folder copy task wasn't processed correctly.
- Web parts - Cache dependencies form control didn't work correctly.

Bugs fixed in hotfix 5.0.1

- StyleSheets – Changing a stylesheet to custom caused an exception.
- PageTemplates – The "Save as new template" action didn't assign new template to the current site.
- MessageBoard – Hiding message board with Check permissions property didn't hide Content before and Content after.
- Tab menu webpart couldn't be added to the page and threw an exception.
- Installation or site import could fail if default database schema wasn't set to 'dbo'.
- Installation wizard – Object types in tree were not selected correctly in specific situations.
- My desk – Message was missing when user had no checked out documents.
- Grid column designer – Minor design issues.
- Search index tasks were improperly logged for export.
- The On-line users web part threw an exception in some cases.
- Cultures couldn't be added to the site in special cases.

Instructions

PLEASE NOTE:

This hotfix wasn't fully tested so you may experience other issues caused by this hotfix.

You should always backup your project and database before applying the hotfix.

Apply the hotfix by performing the following tasks:

1. Backup your original project and database.
2. If an SQL script is available, run the SQL script on your database.
3. Copy & replace the files from the CMS folder to your web project.
4. Add the following configuration to your web.config file (after the ending `</system.web>` tag):

```
<!-- Windows authentication END -->
<location path="cmsgetdoc">
  <system.web>
    <authorization>
      <deny users="?" />
    </authorization>
  </system.web>
</location>
<location path="cmsgetattachment">
  <system.web>
    <authorization>
      <deny users="?" />
    </authorization>
  </system.web>
</location>
```

5. Rebuild the project.
